GEORGIA FIRM RECALLS GROUND BEEF PRODUCTS DUE TO POSSIBLE *E. COLI* O157:H7 CONTAMINATION

WASHINGTON, Oct. 13, 2007 – Arko Veal Co., a Forest Park, Ga., establishment, is voluntarily recalling approximately 1,900 pounds of ground beef products because they may be contaminated with *E. coli* O157:H7, the U.S. Department of Agriculture’s Food Safety and Inspection Service announced today.

The product subject to recall includes:

- 50-pound cases of “BEEF PATTIES MIX,” “80/20.” Each case bears the establishment number “Est. 20766” inside the USDA mark of inspection and a product code of “502250.” Each case bears a production date of “07-Oct-07,” “08-Oct-07” or “09-Oct-07.”

The beef products were produced between Oct. 7 and Oct. 9, 2007, and were distributed to restaurants in Alabama, Georgia, North Carolina and South Carolina. There was no retail distribution of these products.

The problem was discovered through routine FSIS microbiological testing. FSIS has received no reports of illnesses associated with consumption of these products.

Media and consumers with questions about the recall should contact the company president Arkady Miretsky at (404) 534-9337.

E. coli O157:H7 is a potentially deadly bacterium that can cause bloody diarrhea and dehydration. The very young, seniors and persons with compromised immune systems are the most susceptible to foodborne illness.

Consumers with food safety questions can “Ask Karen,” the FSIS virtual representative available 24 hours a day at AskKaren.gov. The toll-free USDA Meat and Poultry Hotline 1-888-MPHotline (1-888-674-6854) is available in English and Spanish and can be reached from 10 a.m. to 4 p.m. (Eastern Time) Monday through Friday. Recorded food safety messages are available 24 hours a day.

Although the product(s) being recalled should be returned to the point of purchase, consumers preparing other ground beef products should heed the following advice.

Consumers should only eat ground beef patties that have been cooked to a safe temperature of 160 °F. When a ground beef patty is cooked to 160 °F throughout, it can be safe and juicy, regardless of color.

The only way to be sure a ground beef patty is cooked to a high enough temperature to kill harmful bacteria is to use an accurate food thermometer.

Color is not a reliable indicator that ground beef patties have been cooked to a temperature high enough to kill harmful bacteria such as *E. coli* O157:H7.

Eating a pink or red ground beef patty without first verifying that the safe temperature of 160 °F has been reached is a significant risk factor for foodborne illness.

Thermometer use to ensure proper cooking temperature is especially important for those who cook or serve ground beef patties to people most at risk for foodborne illness because *E. coli* O157:H7 can lead to serious illness or even death. Those most at risk include young children, seniors, and those with compromised immune systems.

USDA RECALL CLASSIFICATIONS

Class I This is a health hazard situation where there is a reasonable probability that the use of the product will cause serious, adverse health consequences or death.

Class II This is a health hazard situation where there is a remote probability of adverse health consequences from the use of the product.

Class III This is a situation where the use of the product will not cause adverse health consequences.
