Date: December 17, 2004  
To: Health Care Provider  
From: Salena Savarda, BS, Epidemiologist II  
Subject: Influenza Report for Week 49 (Dec. 5-11, 2004)

One hundred twenty-two cases of Influenza-like illness (ILI) were reported during week 49. **Criteria for inclusion as a case of ILI are fever ≥100°F (37.8°C) and cough or sore throat.** The proportion of patient visits to sentinel providers for ILI was 2.27% (weighted average); this is below the national baseline of 2.5%. During week 49, the proportion of mortality due to pneumonia and influenza (P&I) in Clark County was 5.60% and the national P&I mortality was 6.1%. Both percentages are below the epidemic threshold of 7.6% for week 49. Syndromic surveillance has identified no increase in influenza-like illness in the community this season. The proportion of ILI cases by week in Clark County for weeks 40-49 of the 2004-2005 surveillance season is presented in the following figure.

![Proportion of Patient Visits to Sentinel Providers for Influenza-Like Illness (ILI) By Week (Weighted Average) for Weeks 40-49, 2004-2005](image)

Four confirmed cases of influenza have been reported to the Office of Epidemiology (OOE) this season in Clark County. Two of the four were confirmed by throat culture isolates. Both isolates were subtyped as A (H3N2) by the Nevada State Public Health Laboratory. The other two cases were confirmed by a type of rapid test which differentiates between influenza type A and B and both resulted in influenza B. The Nevada law (NAC 441A) requires that healthcare providers report all positive influenza tests (including rapid tests) to the local health authority. Physicians and healthcare workers are reminded that any unusual occurrence or suspected outbreak should be reported to the Office of Epidemiology. The 24-hour number for reporting is 759-1300.

Since October 3, the World Health Organization and National Respiratory and Enteric Virus Surveillance System laboratories have tested a total of 22,873 specimens for influenza viruses, and of these, 1.6% were positive. Among the positive specimens, 69.8% were influenza A viruses and 30.2% were influenza B. Approximately forty-eight percent of the positive influenza A virus isolates have been subtyped and all were influenza A (H3N2) viruses.
