

# Clark County Health Status Report

2007 Supplement, Volume I

*About This Report:* *Clark County Health Status Report Supplement 2007* is the third in a series of reports produced by the Southern Nevada Health District on health-related statistics. This series of reports provides data on the occurrence, prevalence, patterns and trends of selected measures of health and well-being of Clark County residents, with statewide and national comparisons where applicable. *Clark County Health Status Report Supplement 2007, Volume I* provides the most recent data available with a focus on non-communicable diseases and conditions. This report presents a broad statistical summary of selected health indicators for our population, and monitors changes in these indicators over time. The next volume of the 2007 supplement will examine youth health behaviors and outcomes in more detail.

December, 2007

## Commentary

- The Behavioral Risk Factor Surveillance System (BRFSS) is an annual state-based telephone surveillance system developed by the Centers for Disease Control and Prevention (CDC), and comprises CDC-developed core/optional modules and state-added questions. Collection and analysis of the data from BRFSS facilitate monitoring of modifiable risk behaviors and other factors contributing to the leading causes of morbidity and mortality in the population 18 years and older. CDC's 2000-06 BRFSS is the main data source used for indicators related to health behaviors and conditions in this Clark County Health Status Report Supplement.
- Consistent monitoring from year to year of BRFSS indicators is complicated by periodic changes in data definitions, questionnaires or reporting categories. For more information about the survey modules used each year, please visit <http://www.cdc.gov/brfss/index.htm>.
- Indicators are defined and sourced throughout the text and footnotes in this report where applicable. The sources of population and death data for certain community characteristics and mortality indicators differ from those used in the previously published Clark County Health Status Reports. Such changes of supporting data are based on data availability and considerations for data comparability.
- Health indicators contained within this report are presented in the following table:

Community Characteristics	Health Behaviors	Health Conditions/Outcomes	Mortality
Population	Leisure time physical activity/exercise	Overall health status	Infant mortality
Birth rate	Moderate/vigorous physical activity	Physically unhealthy days	Life expectancy
Median income	Fruit & vegetable consumption	Frequent mental distress	Rate and percentage of death by major cause
Low income	Binge drinking	Weight status	Years of potential life lost by major cause
Educational attainment	Heavy drinking	Diabetes	
Unemployment rate	Current smokers	High blood pressure	
Health care access/coverage	Smoking cessation attempts	High cholesterol	
	Cholesterol screening	Asthma history	
	Cancer screening	Current asthma status	
		Disability & aid equipment use	
		Cardiovascular disease

## An Overview of Socio-Economic Context & Population Health

---

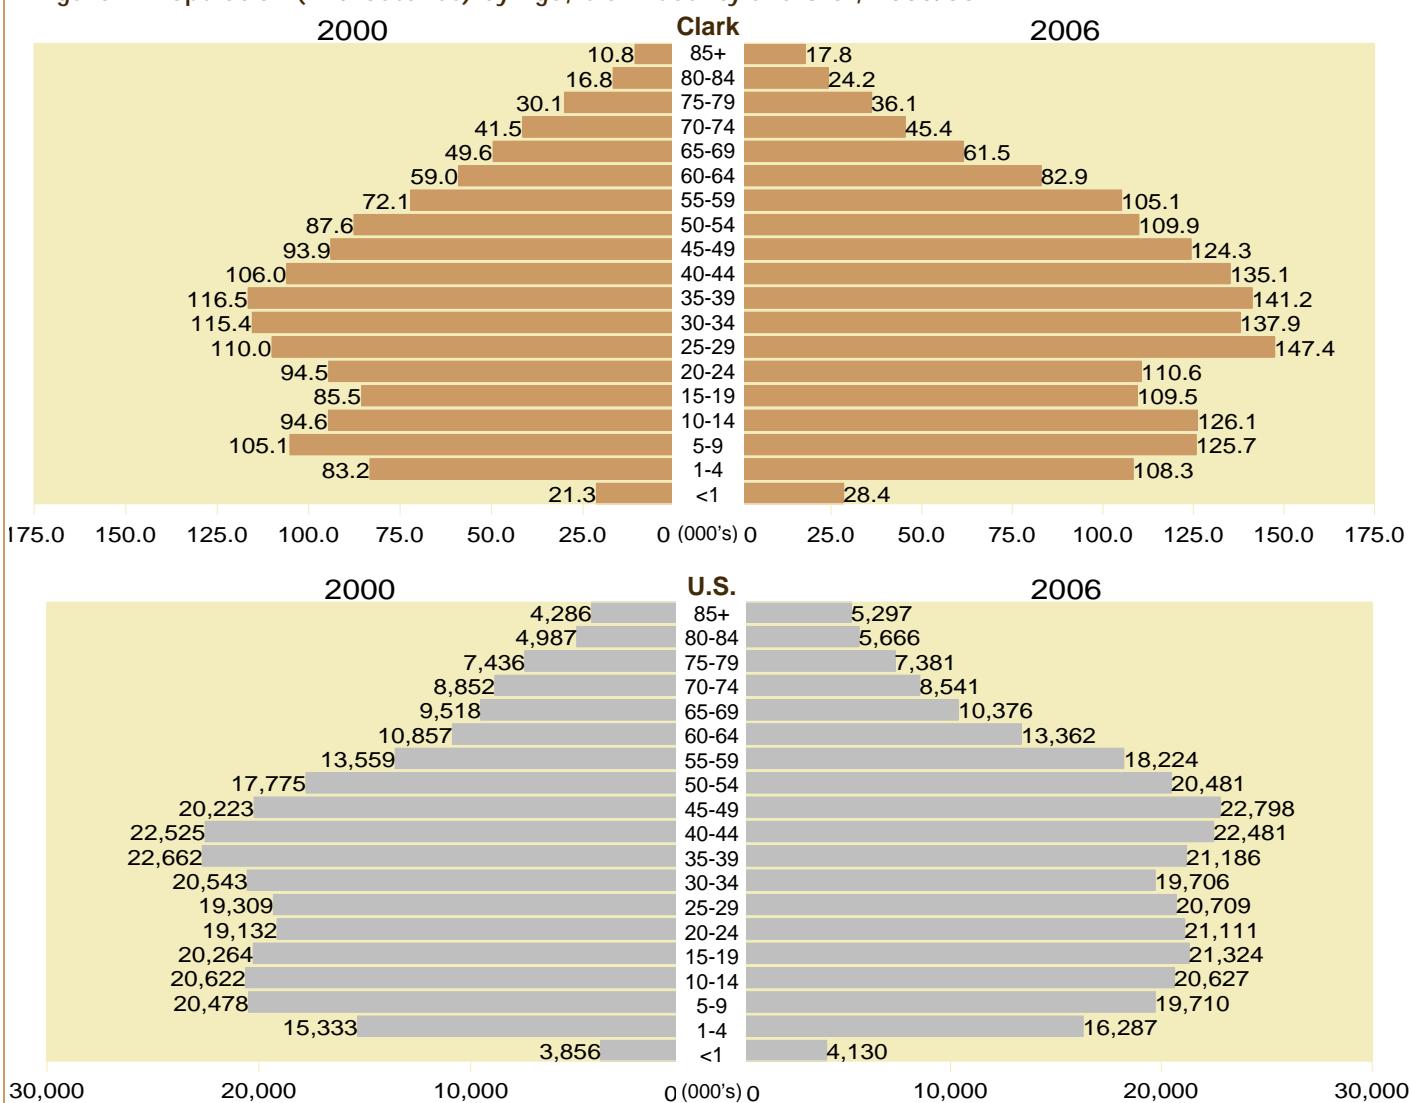

## Demographics

Between 2000 and 2006, the Clark County population showed increases in all age groups, with the 85 years and older age group experiencing the highest percent increase. Nationwide, the 55-59 age group experienced the highest percent increase for the same time period, while the highest percent decrease was seen for the 35-39 age group. For all age groups showing population increases for this time period, Clark County also had higher percent increases when compared to the nation (Figure 1).

According to the U.S. Census Bureau's American Community Surveys, Clark County's population remains relatively young in comparison to the rest of nation. In 2006, the estimated median age of county residents was 34.8 years, compared to a median age of 36.4 years nationwide. However, the median age of county residents is increasing at a faster rate than the nation. Between 2002 and 2006, the estimated median age increased by 0.8 year in the county, compared to an increase of 0.5 year nationwide.

The gender distribution of county residents has remained relatively stable between 2000 and 2006. In 2006, approximately 51% of the population was male (902,969 in numbers) and 49% female (874,570). The Census and post-censal estimates indicate a higher male to female ratio in Clark County when compared to the nation, which was approximately 49% male (147,512,152) and 51% female (151,886,332) in 2006.

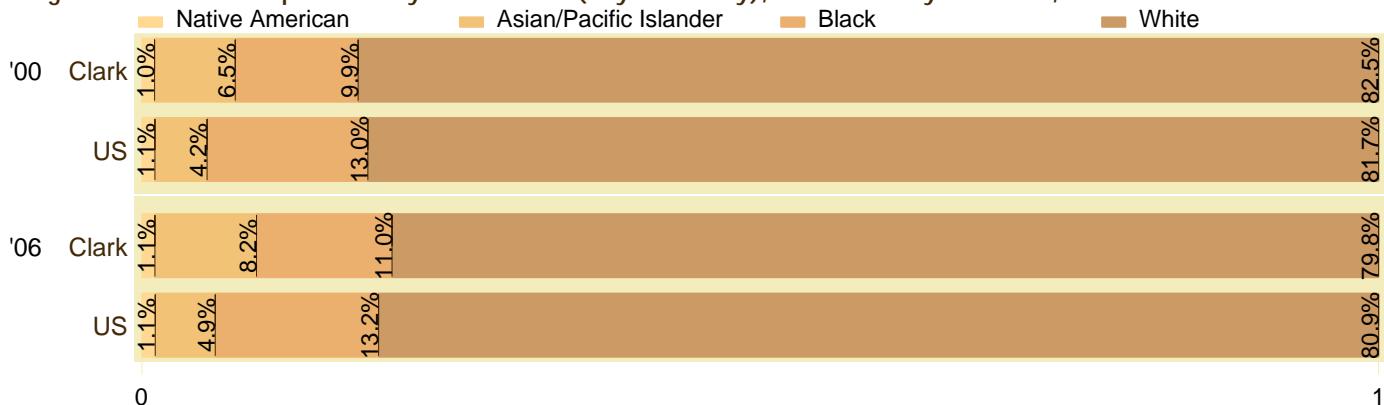

Figure 1. Population (in thousands) by Age, Clark County and U.S., 2000/06

Source: National Center for Health Statistics, Estimates of the July 1, 2000-July 1, 2006, United States resident population from the Vintage 2006 post-censal series with adjustments for under-coverage of the census (accessed in September 2007).

Clark County has a higher percentage of Hispanics relative to most other parts of the nation. The county Hispanic population also increases at a faster rate when compared to the nation as a whole. According to the Census and post-censal estimates, the percentage of the Hispanic population in Clark County increased from 22.1% (307,909) in 2000 to 27.2% (482,899) in 2006, while the nation as a whole saw an increase from 12.6% (35,659,724) in 2000 to 14.8% (44,321,038) in 2006. Regardless of Hispanic origin, whites (any ethnicity) declined from 82.5% (1,149,671) of the county population to 79.8% (1,417,898) between 2000 and 2006; blacks (any ethnicity) increased from 9.9% (138,455) to 11.0% (194,776); Asians or Pacific Islanders (any ethnicity) increased from 6.5% (91,108) to 8.2% (146,031); and Native Americans (any ethnicity) increased from (14,147) 1.0% to 1.1% (18,834). Similar changes in the racial distribution of the population were also seen in the nation between 2000 and 2006 (Figure 2).

**Figure 2. Percent Population by Race Alone (any ethnicity), Clark County and U.S., 2000/06**

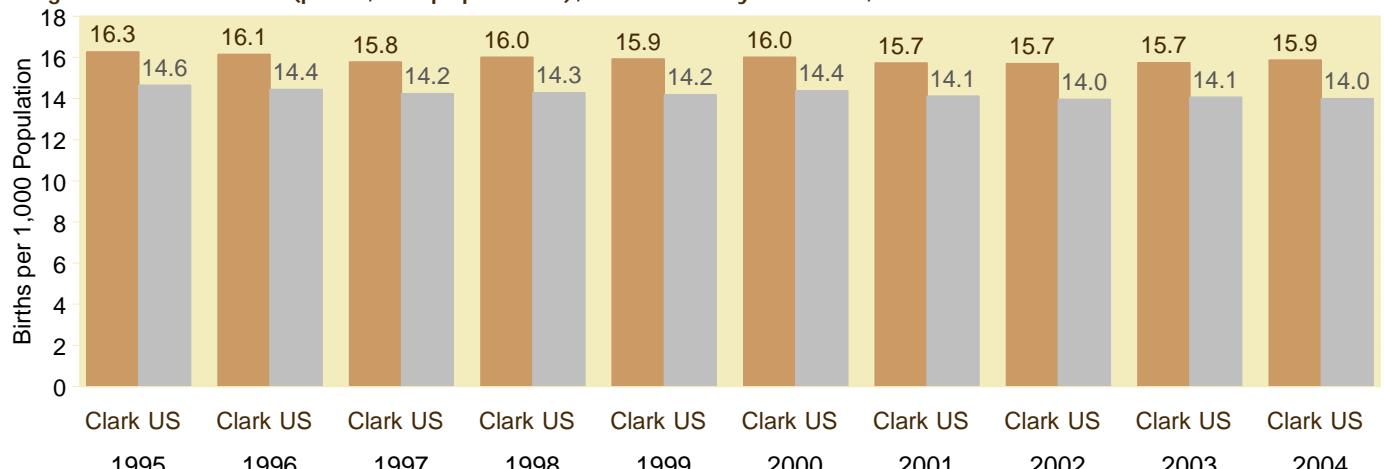

Source: National Center for Health Statistics, Estimates of the July 1, 2000-July 1, 2006, United States resident population from the Vintage 2006 post-censal series with adjustments for under-coverage of the census.

Clark County has seen a progressive rise in actual number of births. According to the natality data from the CDC WONDER on-line database, 26,152 live births were recorded in 2004 in comparison to 16,848 in 1995, an increase of 55%. Clark County has also had a higher birth rate (per 1,000 population) than the nation (Figure 3). Clark County's higher birth rate is consistent with the county's relatively young population when compared to the nation.

Of all the racial/ethnic groups in the county, Hispanics have had the highest birth rate. According to the Nevada Interactive Health Database, 23.9 births per 1,000 population were recorded among Hispanics in the county in 2004, compared to 16.8 among non-Hispanic blacks (BNH) and 10.6 among non-Hispanic whites (WNH).

**Figure 3. Birth Rates (per 1,000 population), Clark County and U.S., 1995-2004**

Source: Population data from National Center for Health Statistics, Vintage 2006 post-censal series. Natality data from the Natality Module on CDC WONDER on-line database (accessed in September 2007).

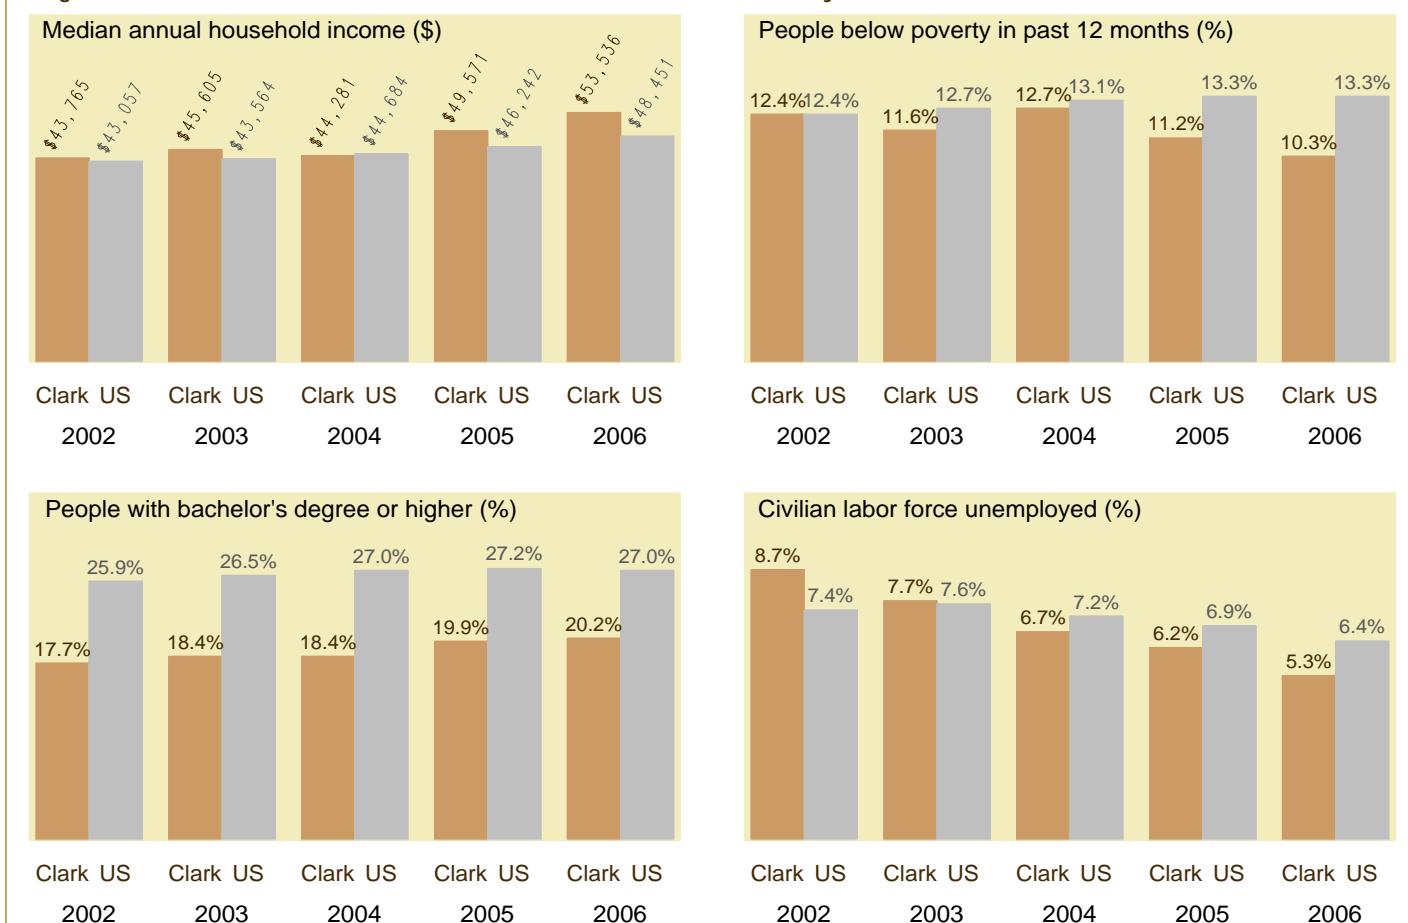

## Social & Economic Characteristics

According to the American Community Surveys (ACS), the median annual household income in Clark County has increased by 22.3% from \$43,765 in 2002 to \$53,536 in 2006, compared to a increase of 12.5% reported for the nation for the same period (Figure 4). The reported median household income in Clark County was also similar to or higher than the nation over the past five years. However, based on the First Quarter 2007 Composite Cost of Living Index published by the American Chamber of Commerce Researchers Association, the state of Nevada had the 37<sup>th</sup> lowest cost of living in the nation. To the extent that the cost of living is higher in Nevada when compared to the nation as a whole, the relatively higher incomes earned by county residents may not translate into a higher standard of living.

Clark County compares relatively well with the rest of the nation in terms of poverty and unemployment rates (Figure 4). In 2006, 10.3% of the county population lived below poverty level (vs. 13.3% in U.S.), compared to 12.4% in 2002. The decline in the county's poverty rate between 2002 and 2006 is noteworthy in light of the slight increase in the nation's poverty rate for the same period. Clark County also saw a progressive decline in the percentage of labor force unemployed, from 8.7% to 5.3% over the past five years. When compared with the nation, the unemployment rate was consistently lower in Clark County over the past three years.

The percentage of high school graduate or higher among county residents has increased from 81.7% in 2002 to 82.9% in 2006, based on the ACS estimates. There has also been a steady rise in the percentage of county residents with a bachelor's or advanced degree over the past five years. However, Clark County still compares poorly with the rest of the nation in the area of education (Figure 4). About 20% of county residents reported having a bachelor's degree or higher in 2006, compared to 27% in the nation. The gap between the county and the nation in receipt of a bachelor's degree or higher is lessening though, from a discrepancy of 8.2% in 2002 to 6.8% in 2006.

## Mortality

Infant mortality is among the most frequently used indicators of the health and social condition of a population. Infant mortality has decreased dramatically over the last century in the U.S. with improvements in sanitation, nutrition, maternal and child health care, although the decline has been slower in recent years (National Vital Statistical Reports [NVSR] 1999-2007). Between 1999 and 2004, the vital statistics data indicated little changes in the overall infant mortality rate (per 1,000 live births) in both the county and the nation (Figure 5).

Racial/ethnic disparities in the risk of infant death remain, with the six-year averaged infant mortality rate among BNH about 2.6 times higher than that for WNH, and about 2.9 times higher than that for Hispanics in the county (Figure 5). BNH also have higher rates of low birth weight than other major racial/ethnic groups. Defined as less than 2,500 grams or 5.5 pounds, low birth weight contributes substantially to both infant mortality and childhood disabilities, and is often associated with preterm delivery, maternal illness, nutrition, smoking and other factors related to socio-economic status. Between 1999 and 2004, an average of 13.5% of births with low birth weight was reported among BNH, compared to 7.3% among WNH and 6.3% among Hispanics (Clark County Health Status Report, Volume I).

Figure 5. Infant Mortality Rates\* (per 1,000 live births) by Race/Ethnicity, Clark County and U.S., 1999-2004

Source: County birth and mortality data from Nevada State Health Division. National vital statistics from NVSR (Vol.53/No.12, Vol.54/No.16 and Vol.55/No.14).

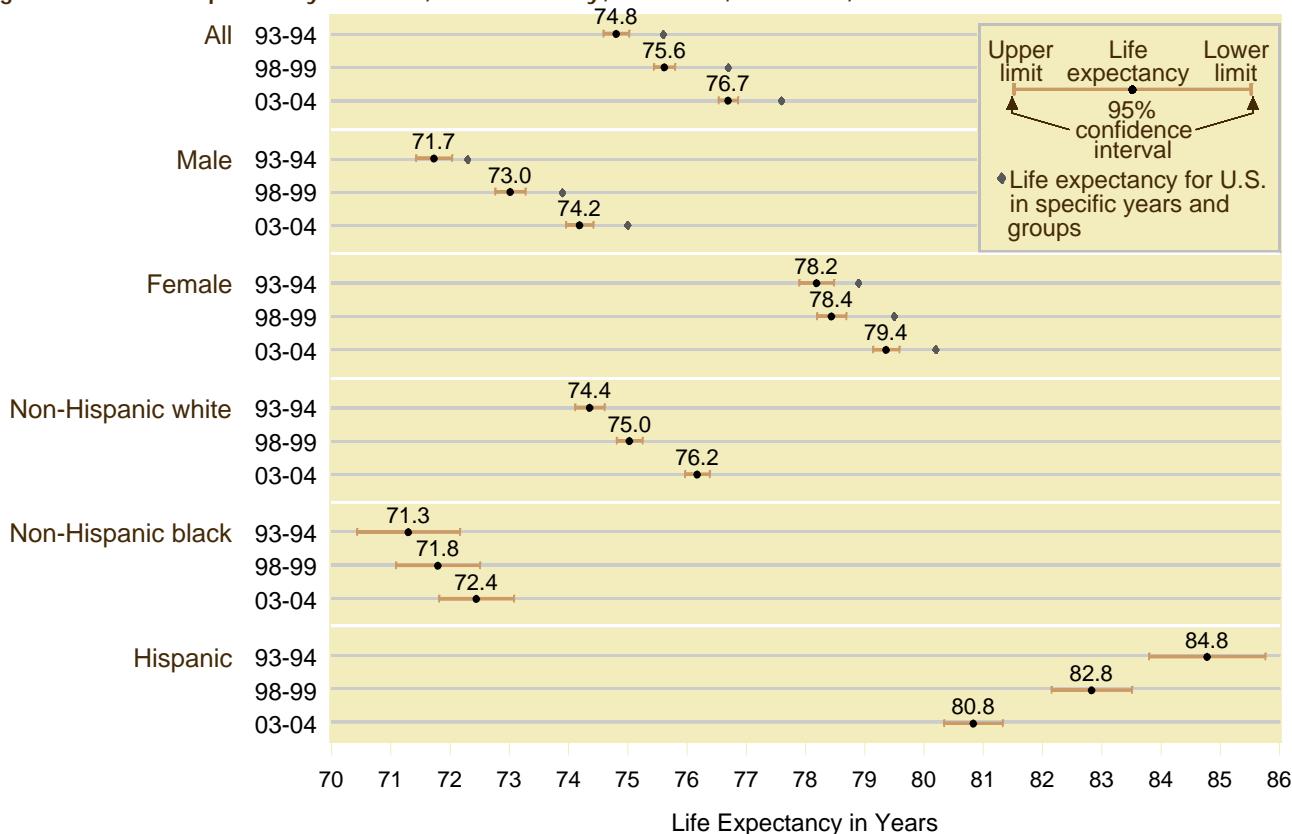

\*Infant mortality rates are deaths occurring less than 1 year, neonatal mortality rates are deaths occurring less than 28 days, and post-neonatal mortality rates are deaths occurring from 28 days to 1 year per 1,000 live births in specified groups. Births of unspecified racial/ethnic origin in the county prorated according to the distribution of births of known racial/ethnic origin in rate calculations.

Life expectancy (LE) is also a widely used measure of population health status and is closely associated with the mortality experience of a population. It is defined as the average number of years an individual can expect to live given the current probability of dying at each age. There have been steady increases in LE among county residents over the last decade, by approximately one year for every five calendar years (Figure 6.1). The estimated LE for county residents born in 2003-04 was 76.7 years, an increase of 1.9 years over the LE at birth in 1993-94. However, county residents' LE is lower than the national average. In 2003-04, the estimated gap between county residents and fellow Americans in LE at birth was 0.9 year. The LE gap of the same two-year period between the county and the nation was narrower for older adults, with county residents expecting to live 0.5 year less than fellow Americans at age 65 (Figure 6.3).

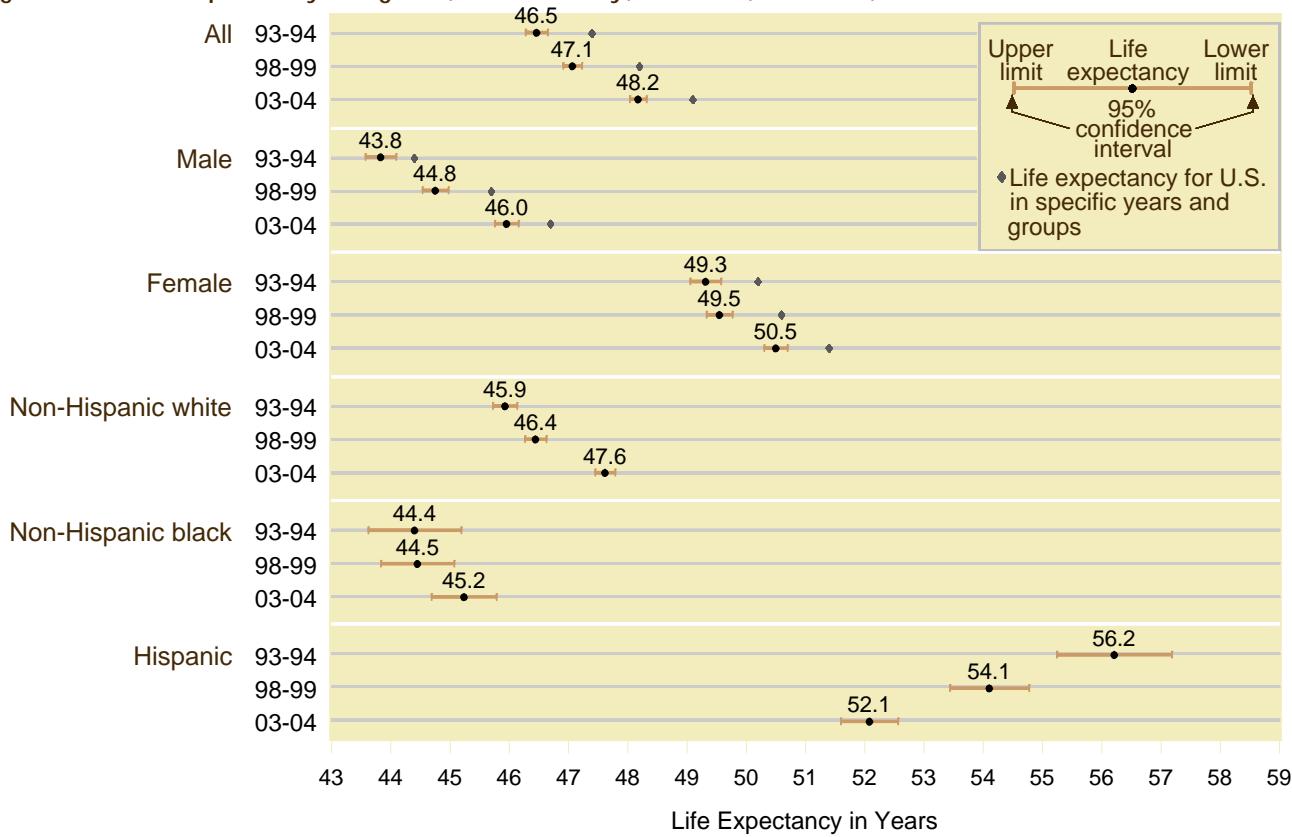

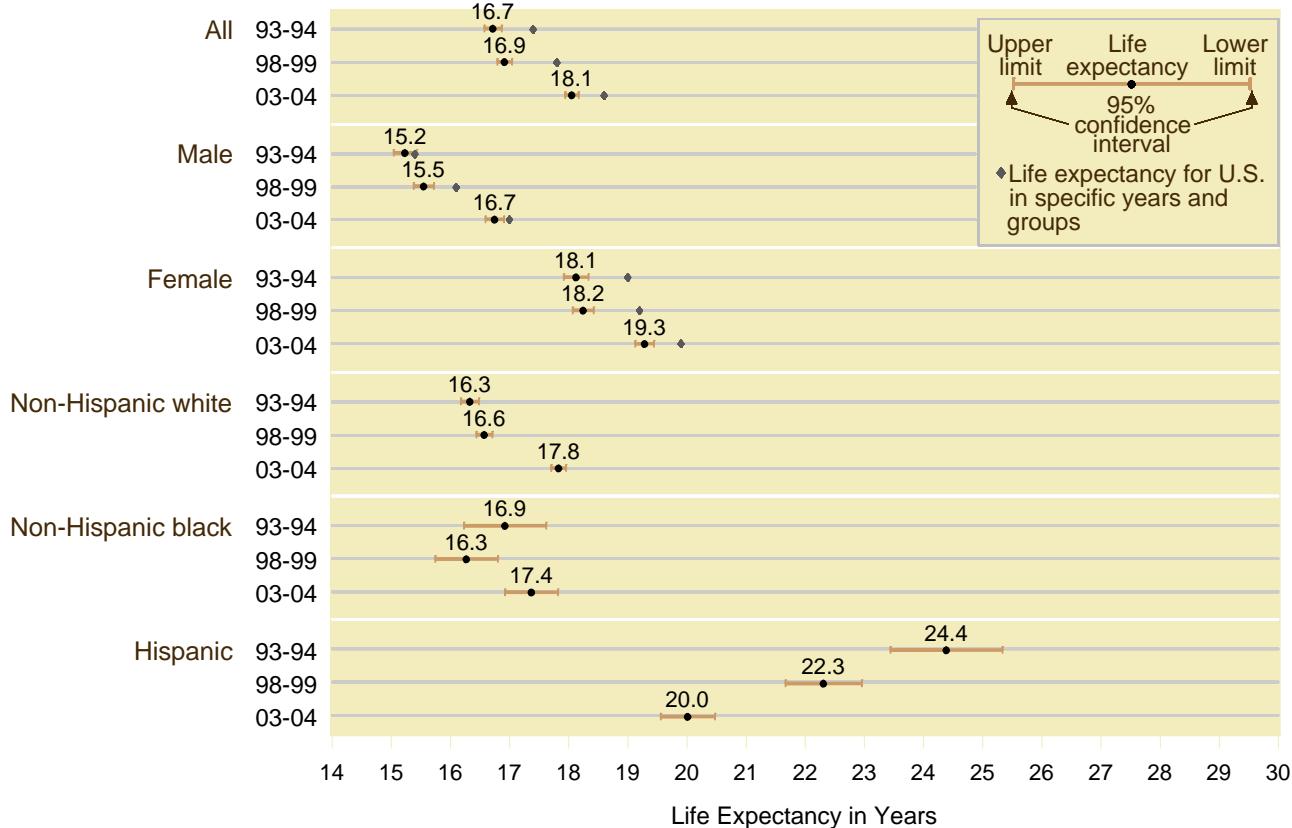

Between 1993 and 2004, LE at birth has increased by 2.5 years to 74.2 years for men and by 1.2 years to 79.4 years for women in Clark County (Figure 6.1). Although the gender gap is narrowing, county male newborns on average expect to live 5.7 years less than county female newborns. When comparing the county to the nation however, there was a slightly wider gap in the averaged LE at birth for females (county: 78.7 yrs vs. U.S.: 79.5 yrs) than for males (county: 73.0 yrs vs. U.S.: 73.7 yrs).

BNH in the county have lived somewhat shorter lives than other major racial/ethnic groups (Figure 6.1). In 2003-04, LE for BNH newborns in the county was 3.8 years less than that for WNH newborns. The higher than overall LE seen among Hispanics is attributable to the 'healthy worker effect', a phenomenon of workers exhibiting death rates lower than those of the general population due to the fact that the severely ill and disabled are ordinarily excluded from employment (Clark County Health Status Report, Volume I). The 'healthy worker effect' is present among the nation's Hispanic population, the majority of whom either are or descend from migrant workers with a minimum level of health required to hold a job. Such selection bias in favor of a healthier population very likely contributes to the lower death rates and higher LE estimates among Hispanics in the country. However, this racial/ethnic gap has been narrowing over the past decade, due to the 'healthy worker effect' gradually diminishing over time.

Figure 6.1. Life Expectancy at Birth, Clark County, 1993/94, 1998/99, and 2003/04

Source: County life expectancy estimates were calculated using two-year aggregated population and mortality data from Nevada State Health Division. Life expectancy estimates at the national level were from NVSR (Vol.53/No.15, Vol.54/No.13, Vol.54/No.19 and Vol.55/No.19) and were single year estimates averaged across the two year period.

**Figure 6.2. Life Expectancy at Age 30, Clark County, 1993/94, 1998/99, and 2003/04**

**Figure 6.3. Life Expectancy at Age 65, Clark County, 1993/94, 1998/99, and 2003/04**

Source: County life expectancy estimates were calculated using two-year aggregated population and mortality data from Nevada State Health Division. Life expectancy estimates at the national level were from NVSR and were single year estimates averaged across the two year period.

Like most developed countries, a large proportion of deaths in the U.S. are due to non-communicable diseases and injuries (Figure 7). Notwithstanding some changes in the rank order, the fifteen leading causes of death in 2004 remained the same as in 2003 in both the county and the nation respectively (Clark County Health Status Report, Volume II). Nationwide, the top fifteen causes of death accounted for 82.7% of all deaths in the U.S. in 2004. In Clark County, fourteen of the top fifteen causes of death were the same as the nation, while mortality from Parkinson's disease was not on the county's list of the fifteen leading causes of death in 2004. Together, these leading causes of death accounted for 83.5% of all deaths in the county in 2004.

As was true in the nation, diseases of heart, malignant neoplasms (cancer) and cerebrovascular diseases were Clark County's top three causes of death in 2004, accounting for 55.3% of all deaths in the county (Figure 7). In rank order, other chronic diseases/conditions among the leading causes of death in the county in 2004 included chronic lower respiratory diseases, Alzheimer's disease, chronic liver disease and cirrhosis, diabetes, and essential hypertension and hypertensive renal disease. Unintentional injuries or accidents rose to the fourth leading cause of death in the county in 2004, while it ranked as the fifth leading cause in 2003 (Clark County Health Status Report, Volume II). Mortality from unintentional injuries, suicide, and assault (homicide) and legal intervention (legal execution by the police or other law-enforcing agents) has also ranked consistently higher in the county than in the nation (Clark County Health Status Report, Volume I & II).

**Figure 7. Top Fifteen Leading Causes of Death\* as Percent of All Deaths, Clark County and U.S., 2004**

Cause of Death Ranked in Clark County		Cause of Death Ranked in U.S.			
Diseases of Heart	Clark US	26.4% (3,203) 27.2% (652,486)	26.4% (3,203) 27.2% (652,486)		
Malignant Neoplasms (Cancer)	Clark US	23.2% (2,810) 23.1% (553,888)	23.2% (2,810) 23.1% (553,888)		
Cerebrovascular Diseases (Stroke)	Clark US	5.8% (700) 6.3% (150,074)	5.8% (700) 6.3% (150,074)		
Unintentional Injuries (Accidents)	Clark US	5.7% (697) 4.7% (112,012)	Chronic Lower Respiratory Diseases	Clark US	5.7% (687) 5.1% (121,987)
Chronic Lower Respiratory Diseases	Clark US	5.7% (687) 5.1% (121,987)	Unintentional Injuries (Accidents)	Clark US	5.7% (697) 4.7% (112,012)
Nephritis, Nephrotic Syndrome and Nephrosis	Clark US	2.8% (337) 1.8% (42,480)	Diabetes	Clark US	1.4% (165) 3.1% (73,138)
Septicemia	Clark US	2.4% (291) 1.4% (33,373)	Alzheimer's Disease	Clark US	1.7% (202) 2.8% (65,965)
Influenza and Pneumonia	Clark US	2.3% (280) 2.5% (59,664)	Influenza and Pneumonia	Clark US	2.3% (280) 2.5% (59,664)
Suicide	Clark US	2.3% (278) 1.4% (32,439)	Nephritis, Nephrotic Syndrome and Nephrosis	Clark US	2.8% (337) 1.8% (42,480)
Alzheimer's Disease	Clark US	1.7% (202) 2.8% (65,965)	Septicemia	Clark US	2.4% (291) 1.4% (33,373)
Assault (Homicide) and Legal Intervention	Clark US	1.4% (168) 0.7% (17,729)	Suicide	Clark US	2.3% (278) 1.4% (32,439)
Chronic Liver Disease and Cirrhosis	Clark US	1.4% (166) 1.1% (27,013)	Chronic Liver Disease and Cirrhosis	Clark US	1.4% (166) 1.1% (27,013)
Diabetes	Clark US	1.4% (165) 3.1% (73,138)	Essential (Primary) Hypertension and Hypertensive Renal Disease	Clark US	0.6% (74) 1.0% (23,076)
Essential (Primary) Hypertension and Hypertensive Renal Disease	Clark US	0.6% (74) 1.0% (23,076)	Parkinson's Disease	Clark US	0.5% (59) 0.8% (17,989)
Pneumonitis Due To Solids and Liquids	Clark US	0.6% (68) 0.7% (16,780)	Assault (Homicide) and Legal Intervention	Clark US	1.4% (168) 0.7% (17,729)

Source: Mortality Module on CDC WONDER on-line database (accessed in September 2007).

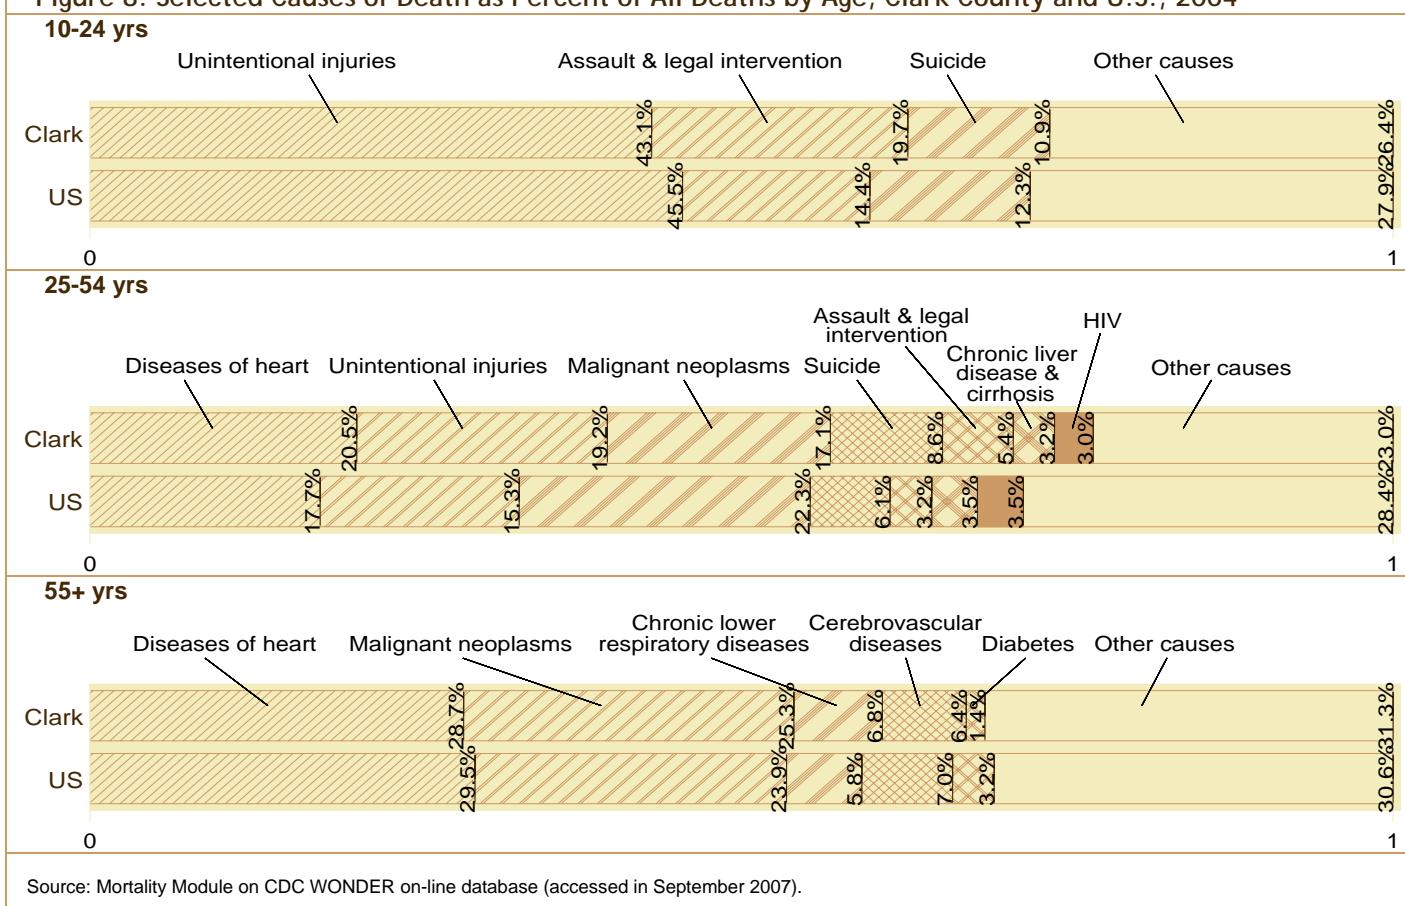

\*Among the 113 causes selected by NVSR. Rank based on number of deaths. Percent of deaths annotated on graphs with number of deaths by underlying cause of death in parentheses.

Indicates that the percent of death accounted for by the specific cause in Clark County exceeded that in the U.S. by 0.5% or higher.

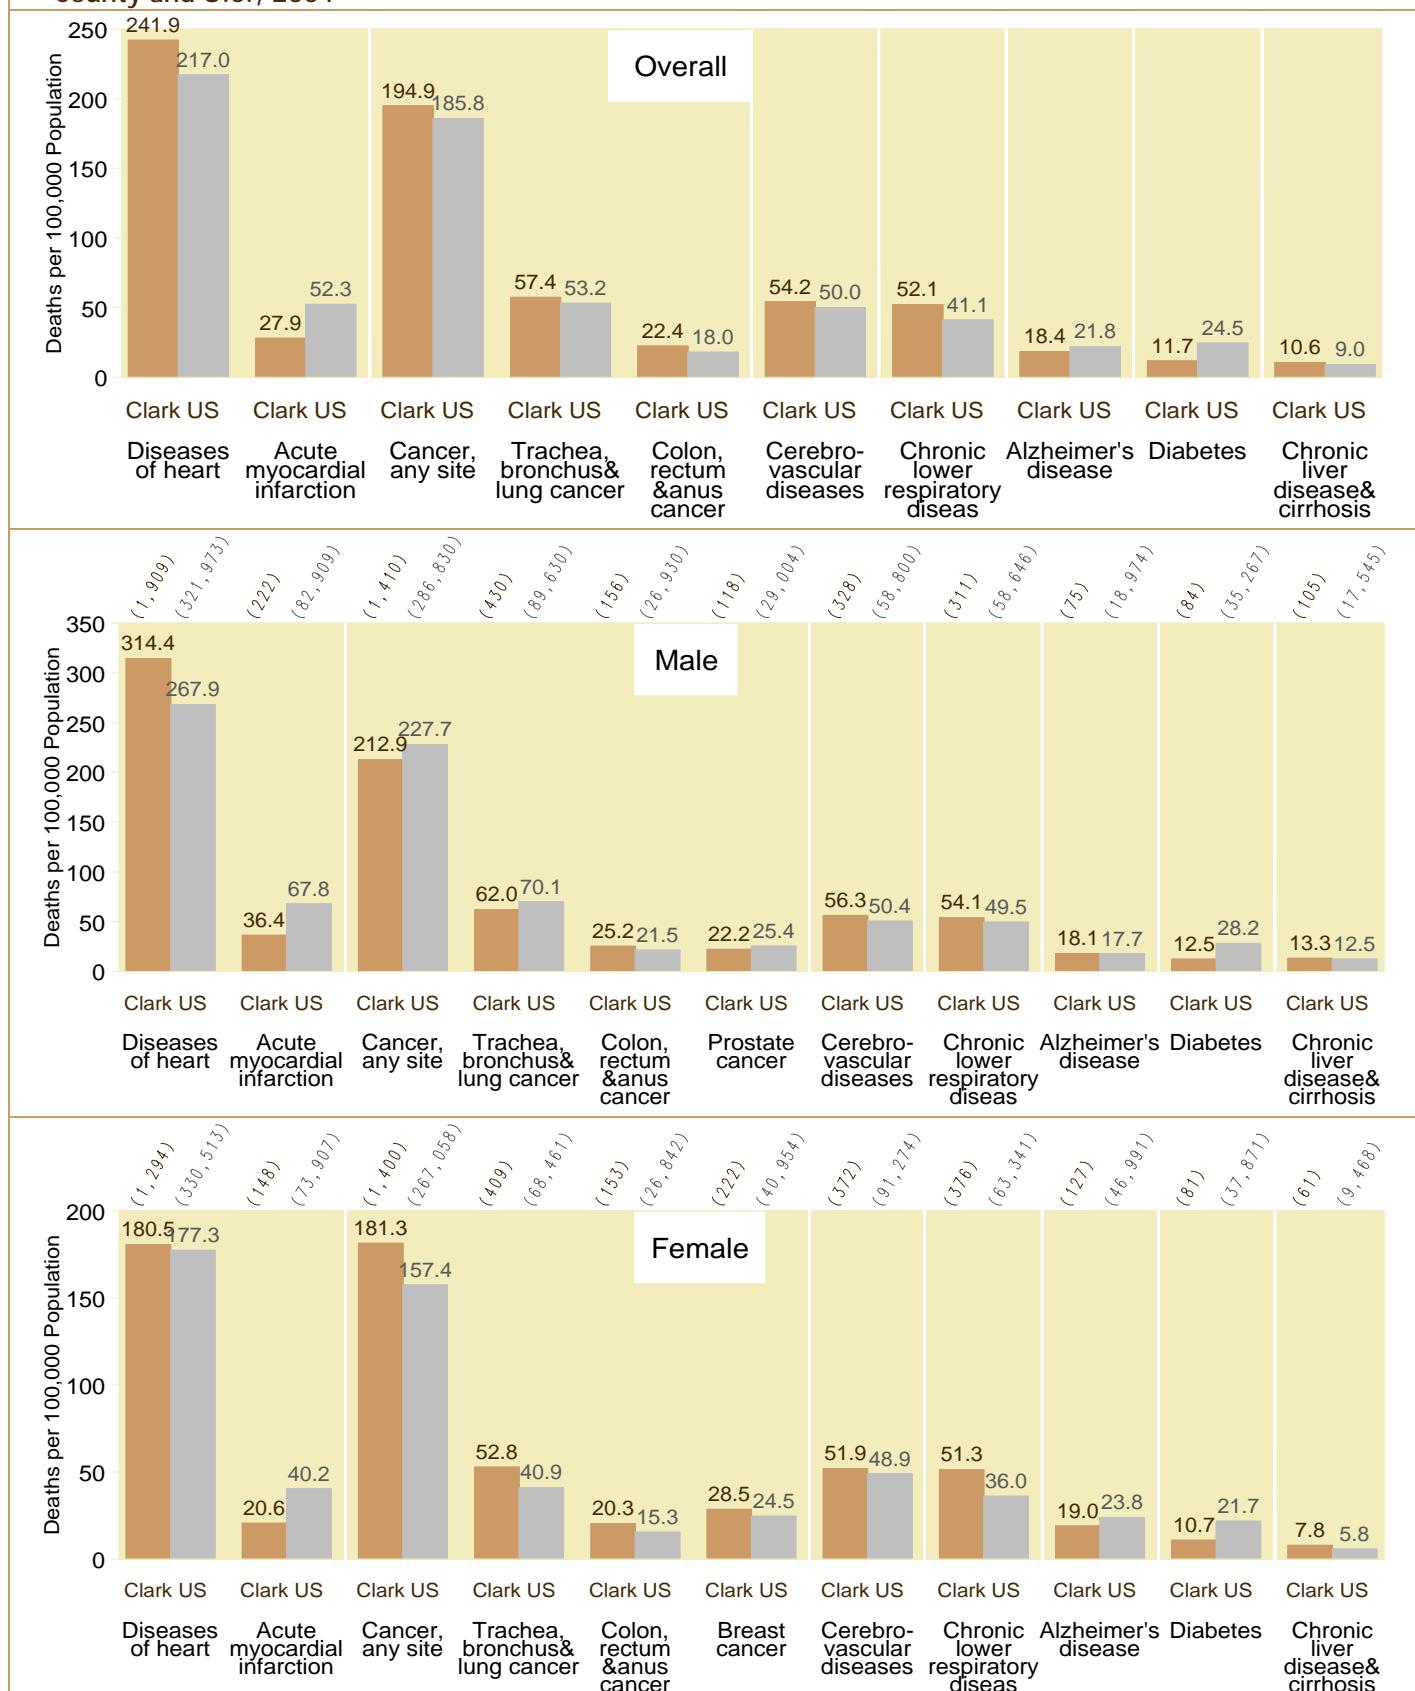

Among persons aged 10 to 24 years, accidents, assault and legal intervention and suicide were the top three causes of death. In 2004, 73.6% of all deaths among county residents aged 10 to 24 years resulted from these causes (Figure 8). Assault and legal intervention also accounted for a higher percentage of deaths in this age group in the county than in the nation (19.7% vs. 14.4%). Among persons aged 25 to 54 years, diseases of heart, accidents, suicide, assault and legal intervention accounted for higher percentages of deaths in the county than in the nation in 2004 (Figure 8). Among persons aged 55 years and older, the leading chronic disease killers in the county in 2004 included diseases of heart (accounting for 28.7% of all deaths in this age group), cancer (25.3%), chronic lower respiratory diseases (6.8%), cerebrovascular diseases (6.4%), Alzheimer's disease (2.1%), diabetes (1.4%), chronic liver disease and cirrhosis (1.1%), essential hypertension and hypertensive renal disease (0.7%), Parkinson's disease (0.6%) and atherosclerosis (0.4%). Together, these causes accounted for 73.5% of all deaths among county residents aged 55 years and older in 2004 (CDC WONDER Mortality Module).

Since the risk of dying varies according to age, and Clark County's population is younger than the nation as a whole, standardizing populations for age helps eliminate the differences in mortality between populations that are the result of the differences in age distribution. In 2004, Clark County had a higher age-adjusted or age-standardized death rate (per 100,000 population) relative to the nation for diseases of heart, cancer, cerebrovascular diseases, chronic lower respiratory diseases, and chronic liver disease and cirrhosis (Figure 9). Within each gender, these diseases also registered higher death rates in the county than in the nation with the exception that for males, cancer of all sites combined contributed to a slightly lower than U.S. death rate in the county in 2004. When compared with national gender-specific death rates however, both males and females in the county had higher mortality rates for colorectal cancer. Higher than national gender-specific death rates were also seen among county females for lung/breast cancer, breast cancer and cancer of all sites combined. Relative to females, males in both the county and the nation showed a higher mortality rate for diseases of heart, cancer, cerebrovascular diseases, chronic lower respiratory diseases, diabetes, and chronic liver disease and cirrhosis. Females on the other hand, had a higher mortality rate for Alzheimer's disease than males in both the county and the nation.

**Figure 8. Selected Causes of Death as Percent of All Deaths by Age, Clark County and U.S., 2004**

**Figure 9. Age-Adjusted Death Rates\* (per 100,000 population) by Selected Cause of Death and Gender, Clark County and U.S., 2004**

Source: Mortality Module on CDC WONDER on-line database (accessed in September 2007).

\*Age-adjusted to the 2000 U.S. standard population. Gender-specific rates used population of each sex as denominator. Number of deaths by gender in parentheses.

Years of potential life lost (YPLL) is another often used measure of population health and is strongly associated with death rates in every stage of life. It takes into account the remaining life expectancy at each age of death, or the number of years of life ‘lost’ when a person dies from any cause. Since the number of potential years left to live is higher for premature or untimely deaths, YPLL gives more importance to deaths occurring at younger ages and is thus often used as an indicator of premature mortality. In addition, cause-specific YPLL provides a summary measure of the impact of certain causes of death on a population. Due to the fact that premature deaths are associated with higher YPLL values, causes young people are more likely to die from often rank higher on YPLL than on number of deaths, particularly unintentional and intentional injuries.

Based on mortality data averaged from 1999 to 2004, WNH had the highest YPLL from diseases of heart, cancer, chronic lower respiratory diseases and Alzheimer’s disease among all racial/ethnic groups in the county (Table 1). WNH in the county also had 1.3 times more YPLL from chronic liver disease/cirrhosis and from suicide respectively than county residents as a whole. Among all racial/ethnic groups in the county, BNH had the highest YPLL from cerebrovascular diseases, diabetes, HIV disease, and assault/legal intervention. With 606.5 years lost per 100,000 population due to HIV disease and 1580.5 years lost per 100,000 due to assault/legal intervention, BNH in the county had 3.4 times more YPLL from these two causes respectively than county residents as a whole. The same years’ data indicated that Native Americans had the highest YPLL from chronic liver disease/cirrhosis, influenza/pneumonia, accidents and suicide among all racial/ethnic groups in the county. Native Americans also had 1.4 times more YPLL from chronic lower respiratory diseases and 1.3 times more YPLL from diabetes than county residents as a whole. The lower than overall YPLL seen among Hispanics for most cause of death categories is consistent with Hispanics’ higher than overall life expectancies. The favorable mortality outcomes among Hispanics are partly a function of the previously mentioned ‘healthy worker effect’, which posits a selection bias in favor of Hispanic immigrants with relatively good health. Also, it should be noted that Hispanic deaths are likely underreported due to misclassification of race/ethnicity on death certificates (*Healthy People 2010: understanding and improving health*, 2<sup>nd</sup> ed.). In addition, the relatively young age of the Hispanic population in the county partially accounts for the high rankings on YPLL for unintentional injuries and assault/legal intervention among the leading causes of death for Hispanics.

Table 1. Years of Potential Life Lost\* (per 100,000 population) by Selected Cause of Death and Race/Ethnicity, Clark County, Average 1999-2004

	All Origins	Hispanic	White, Non-Hispanic	Black, Non-Hispanic	Asian/Pacific Islander, Non-Hispanic	Native American, Non-Hispanic
All causes of death	14872.19	6787.24	18241.66	17676.08	8910.06	15244.38
Diseases of heart	3333.07	909.72	4376.98	3772.02	1668.21	2325.85
Acute myocardial infarction	458.71	112.28	630.22	374.94	240.86	328.57
Cancer, any site	3269.66	872.59	4367.52	2962.85	2254.88	1693.83
Cancer of trachea, bronchus & lung	981.07	142.37	1395.31	751.76	460.24	425.55
Cancer of colon, rectum & anus	275.94	67.97	365.57	272.79	212.59	57.10
Cerebrovascular diseases	655.62	250.01	772.65	919.13	734.72	665.98
Chronic lower respiratory diseases	677.22	107.83	990.85	382.07	163.91	923.26
Alzheimer’s disease	91.97	14.38	133.31	67.77	22.14	39.88

Source: Population and mortality data from Nevada Interactive Health Database System (NIHDS) (accessed in September 2007). Comparable national data not available.

\*Life expectancy data by specific age groups were used to calculate YPLL. Each decedent's remaining life expectancy at the time of death was summed to calculate the total YPLL for each cause of death.

## **Health Status Highlights**

(Based on available Behavioral Risk Factor Surveillance System data from 2000 to 2006)

### **Self-rated health status, physical and mental health**

- About 18% of county adults aged 18 years and older reported poor or fair health status in 2006, with Hispanics reporting the highest percentage (26%) among all racial/ethnic groups.
- Women were more likely to report poor or fair health and frequent mental distress than men. Women also reported roughly two more physically unhealthy days per month than men.
- The percentage of adults reporting poor or fair health increased with age. Older adults also reported many more physically unhealthy days than younger adults, due to the many chronic diseases and their related activity limitations that increase with age, such as diabetes, hypertension, high cholesterol, cardiovascular disease and cancer.
- Self-perceived health status improved with income status and educational attainment. Higher household income and educational level were also associated with fewer mentally or physically unhealthy days.

### **Access to health care**

- About 19% of county adults reported no insurance coverage of any kind in 2006. Lack of health insurance coverage was more prevalent among Hispanics (47%) than other racial/ethnic groups.
- Self-reports of no insurance coverage among county adults increased significantly between 2000 and 2006. The percentage of county adults with no insurance coverage was also consistently higher than national medians during the same period.
- Access to health care improved with age, income and educational status.

### **Selected health risks and chronic health conditions**

- About one in two county adults did not undertake physical activities at levels recommended for health benefits, including about one in four who reported no leisure time activity or exercise at all. Recent data also suggest a slight increase in the proportion of county adults with no leisure time physical activity or exercise.
- More than one-third of county adults aged 65 years and older did not engage in leisure time physical activities. Lack of physical activity or exercise was also more prevalent among women than men, and among Hispanics and BNH than other racial/ethnic groups in the county.
- Lack of or insufficient physical activity was more frequently reported among county adults of fair or poor health status than those of good or better health status.
- Less than a quarter (22%) of county adults consumed five or more daily servings of fruits and vegetables, markedly under the Healthy People 2000 nutrition target of 50%.
- Almost one in five county adults engaged in binge drinking. The prevalence of binge drinkers in the county was more than three times higher for men than for women, and about twice as high in adults aged 18 to 34 years as in the general adult population. The binge drinking prevalence among county adults has also been higher than national medians in 2000-05.
- About one in ten county adults aged 18 to 24 years engaged in heavy drinking. Self-reported heavy drinking was also more prevalent among men than woman, and among WNH than other racial/ethnic groups in the county. Although the heavy drinking prevalence among county adults in 2006 (5%) was the lowest since 2000, heavy drinking was more prevalent in the county than in the nation in 2000-05.
- About one in four county adults smoked currently in 2006, compared with a significantly higher prevalence of current smokers estimated at 30% in 2000. Although smoking rates have declined between 2000 and 2006, the proportion of current smokers in the county was still higher than the national median estimated at 20% in 2006.
- Smoking was more prevalent among non-Hispanics than Hispanics, and among young and middle-aged adults than older adults. The prevalence of current smokers was also higher among county adults of fair or poor health status than those of good or better health status.

- More than a quarter of county adults were obese in 2006, compared with a significantly lower obesity prevalence estimated at 18% in 2000. The proportion of county adults who are either overweight or obese has also increased significantly from 54% in 2000 to 65% in 2006.
- Obesity was more prevalent among BNH and Hispanics than other racial/ethnic groups, and among county adults reporting no leisure time activity or exercise than those reporting some leisure time physical activities.
- Diabetes prevalence among county adults has increased slightly from 6% in 2001 to 8% in 2006.
- About one in four county adults had hypertension and about one in three had high cholesterol. The hypercholesterolemia prevalence was consistently higher in the county than in the nation. There was no clear trend in the prevalence of hypertension or hypercholesterolemia among county adults since 2000.
- The risk for many chronic diseases and conditions increases with age. In 2006, about one in five county adults aged 65 years and older had diabetes, about one in four had some form of cardiovascular disease, and about one in two had hypertension or high cholesterol.
- The prevalence of many chronic diseases and conditions varies by race/ethnicity. Based on age-adjusted prevalence estimates (AAPE), about 11% of Hispanic and BNH county adults had diabetes, compared with 6% of WNH county adults. About 34% of BNH county adults had hypertension, compared with 25% of Hispanic and 24% of WNH county adults. AAPE also indicated lower prevalence of asthma and cardiovascular disease among Hispanics than other racial/ethnic groups in the county.

## Health Status

Indicator 1: Self-perceived health status, rated from excellent, very good, good, fair to poor.

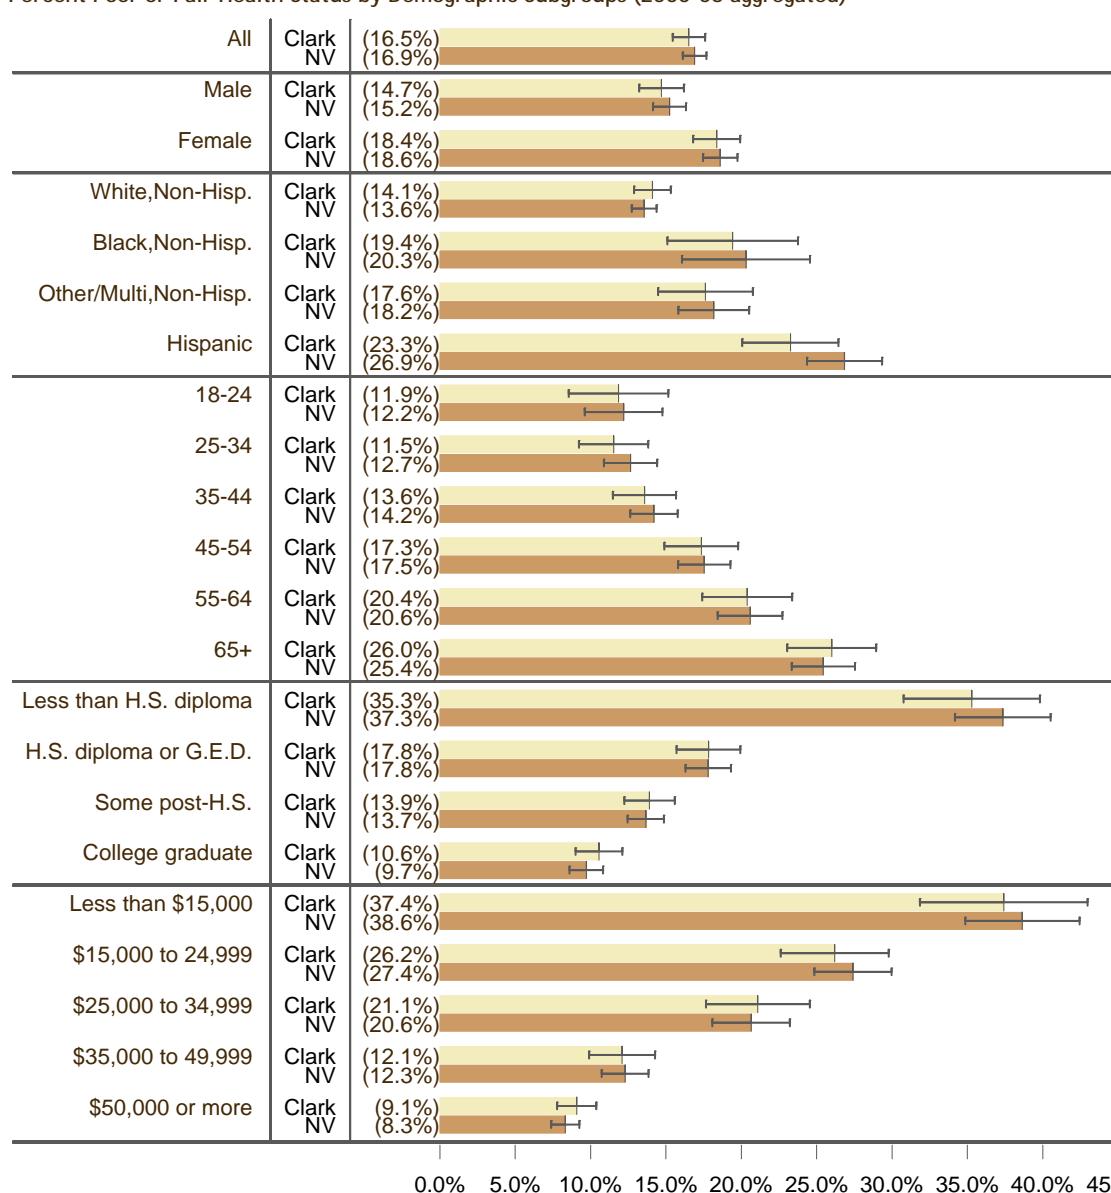

▪ 16.5% of county residents rated their overall health status as poor or fair, based on aggregated county data from 2000-06 (Figure 1).

▪ Hispanics reported the highest percentage of poor or fair health among all racial/ethnic groups based on age-adjusted prevalence estimates (Table 1).

**Indicator 2: Physically unhealthy days, defined as the overall number of days during the previous 30 days when self-reported physical health (including physical illness and injury) was not good.**

- The mean number of physically unhealthy days in the last 30 days reported by county residents was 3.6 days based on aggregated county data from 2000-06 (Figure 4).

**Indicator 3: Frequent mental distress (FMD), defined as reporting 14 or more days in the past 30 days when mental health was not good because of stress, depression and problems with emotions.**

- 10.9% of county residents reported FMD based on aggregated county data from 2000-06 (Figure 7).
- Unlike physical health which worsens as one gets older, mental health appeared to improve with age for older adults (Figure 7).

## Health Care Access / Coverage

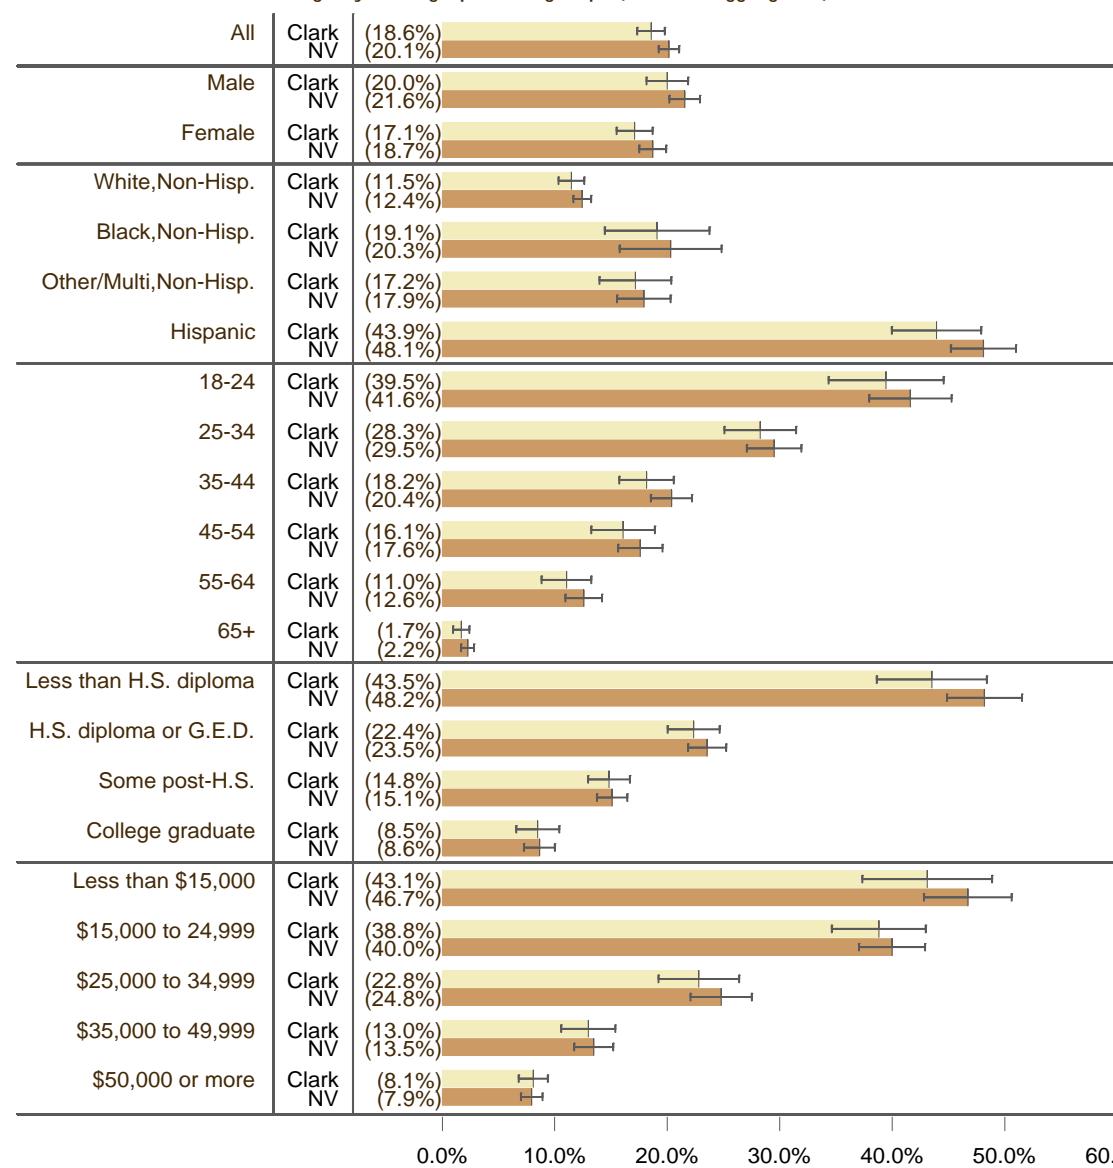

Indicator: Self-reported health care coverage including health insurance, prepaid plans and governmental plans.

- 18.6% of county residents reported having no health insurance of any kind based on aggregated county data from 2000-06 (Figure 10).
- Hispanics reported a significantly higher percentage of no insurance coverage than other racial/ethnic groups (Figure 10).

## Physical Activity

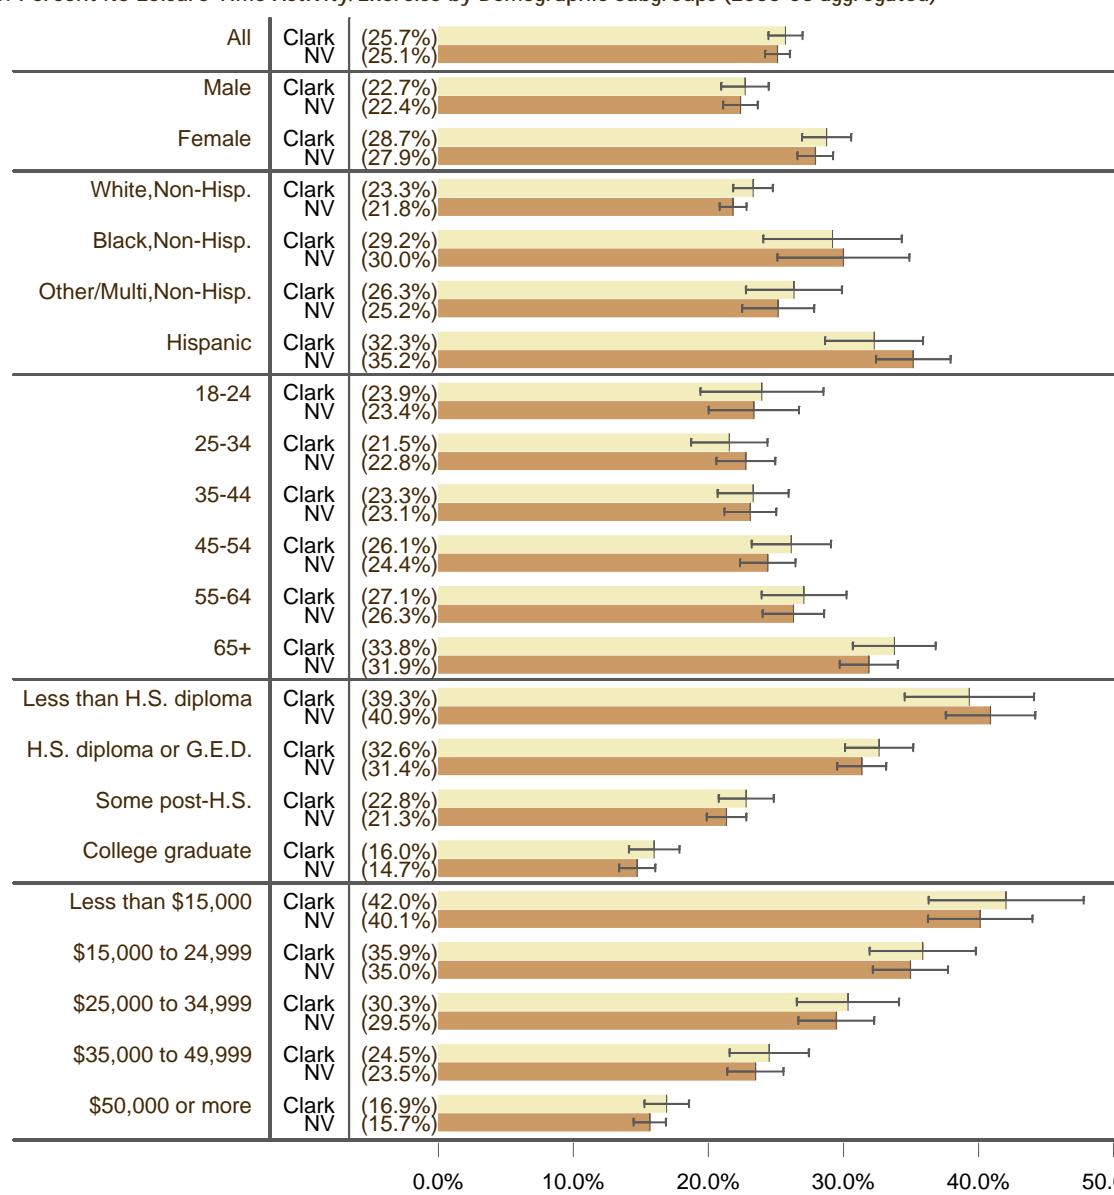

Indicator 1: Self-reported leisure time physical activities or exercises in the past 30 days.

- 25.7% of county residents reported having no leisure time physical activity or exercise based on aggregated county data from 2000-06 (Figure 13).
- Lack of leisure time activities was more prevalent among Hispanics and non-Hispanic blacks than other racial/ethnic groups.

**Indicator 2: Self-reports of 30+ minutes of moderate physical activity per day on five or more days per week, or vigorous activity for 20+ minutes per occasion on three or more days per week.**

- Based on aggregated county data from 2000-06, about one-half of county residents engaged in moderate physical activity for at least 30 minutes five or more days per week, or vigorous physical activity for 20 or more minutes three or more days per week, while about one-half did not (Figure 16).

**Indicator 3: Self-reports of 20+ minutes of vigorous activity per occasion on three or more days per week.**

- Based on aggregated county data from 2000-06, about 30% of county residents engaged in sufficient vigorous physical activity, while about 70% did not (Figure 19).

## Alcohol Consumption

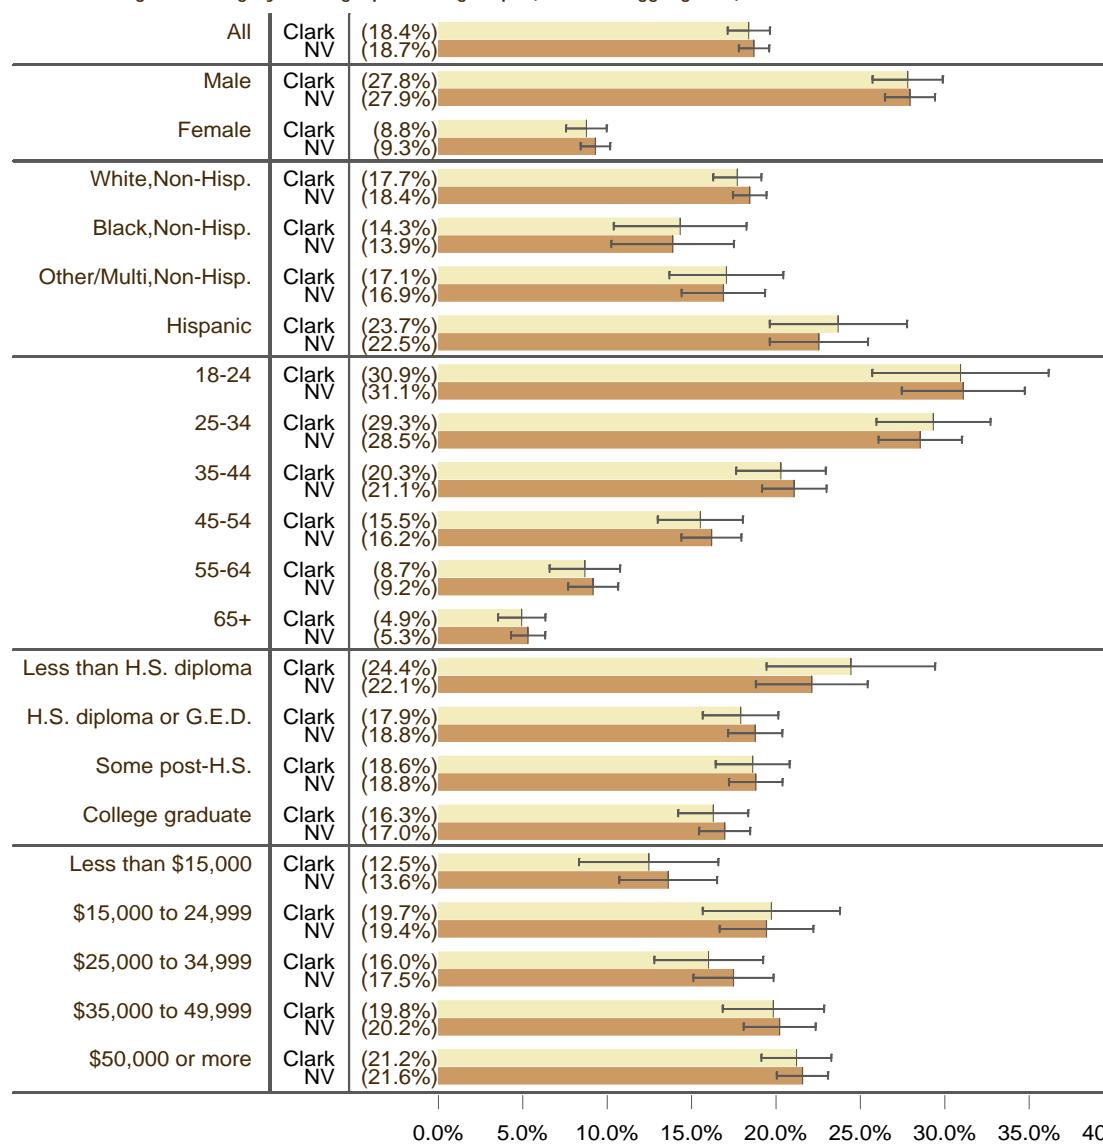

Indicator 1: Binge drinking<sup>#</sup>, defined as having five or more drinks on one or more occasions in the past 30 days (<sup>#</sup>newly defined as males having five or more drinks on one occasion or females having four or more drinks on one occasion since year 2006).

- 18.4% of county residents engaged in binge drinking based on aggregated county data from 2000-06 (Figure 25).
- Binge drinking was more prevalent among non-Hispanic whites than other racial/ethnic groups based on age-adjusted prevalence estimates (Table 41).

**Indicator 2: Heavy drinking, defined as drinking more than two drinks per day on average for men or more than one drink per day on average for women.**

- 6.9% of county residents engaged in heavy drinking based on aggregated county data from 2000-06 (Figure 28).
- Heavy drinking was more prevalent among non-Hispanic whites than other racial/ethnic groups based on age-adjusted prevalence estimates (Table 46).

## Tobacco Use

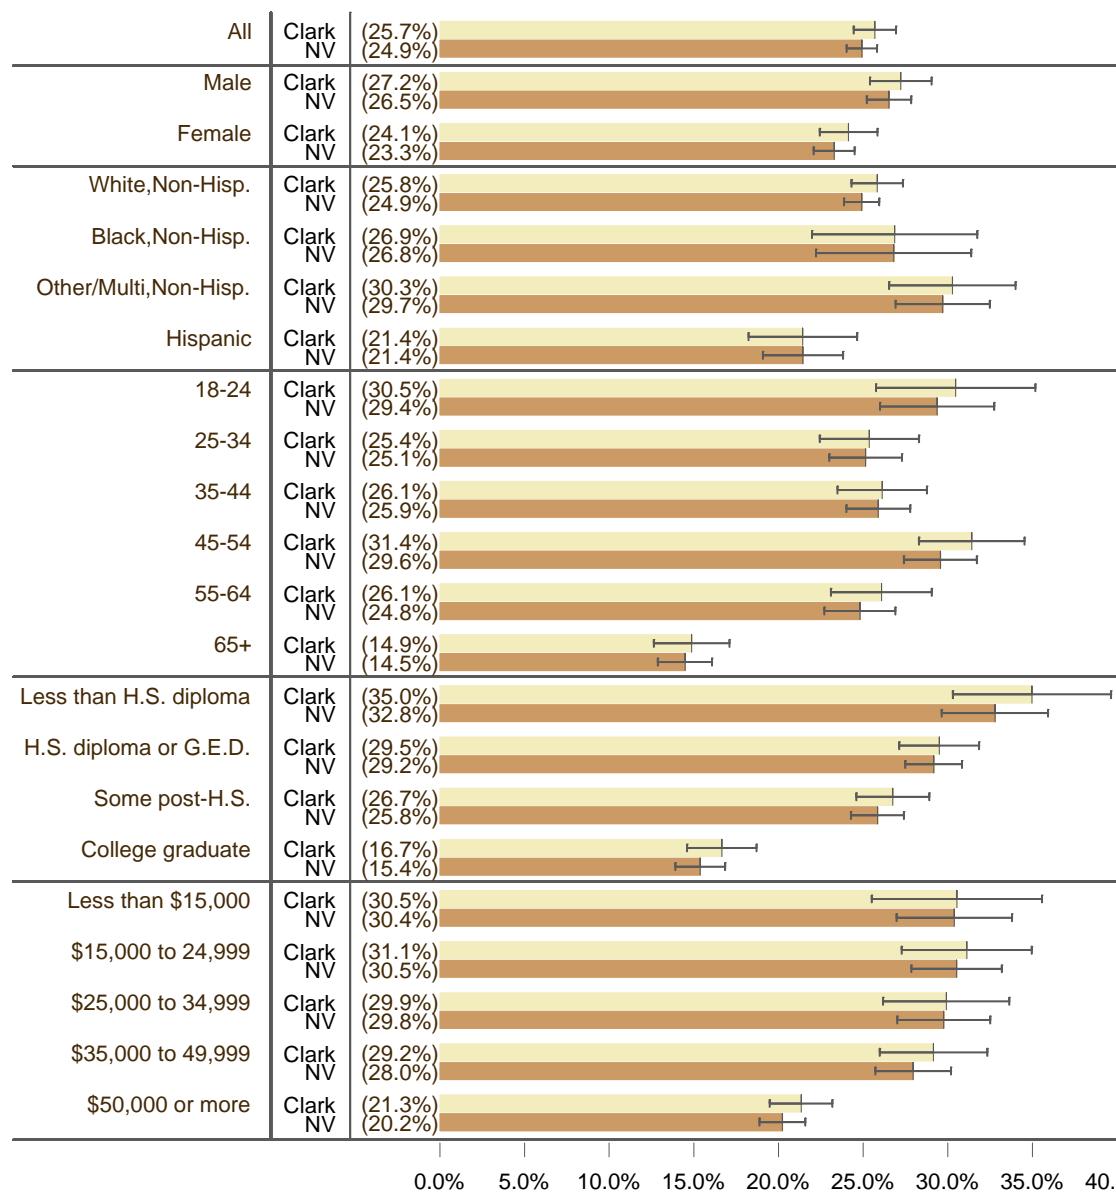

Indicator 1: Smoke everyday or some days currently.

- The prevalence of current smokers among county residents was 25.7% based on aggregated county data from 2000-06 (Figure 31).
- Hispanics were less likely to smoke compared with other racial/ethnic groups.

## Indicator 2: Stopped smoking one day or longer in the past 12 months because of cessation attempts.

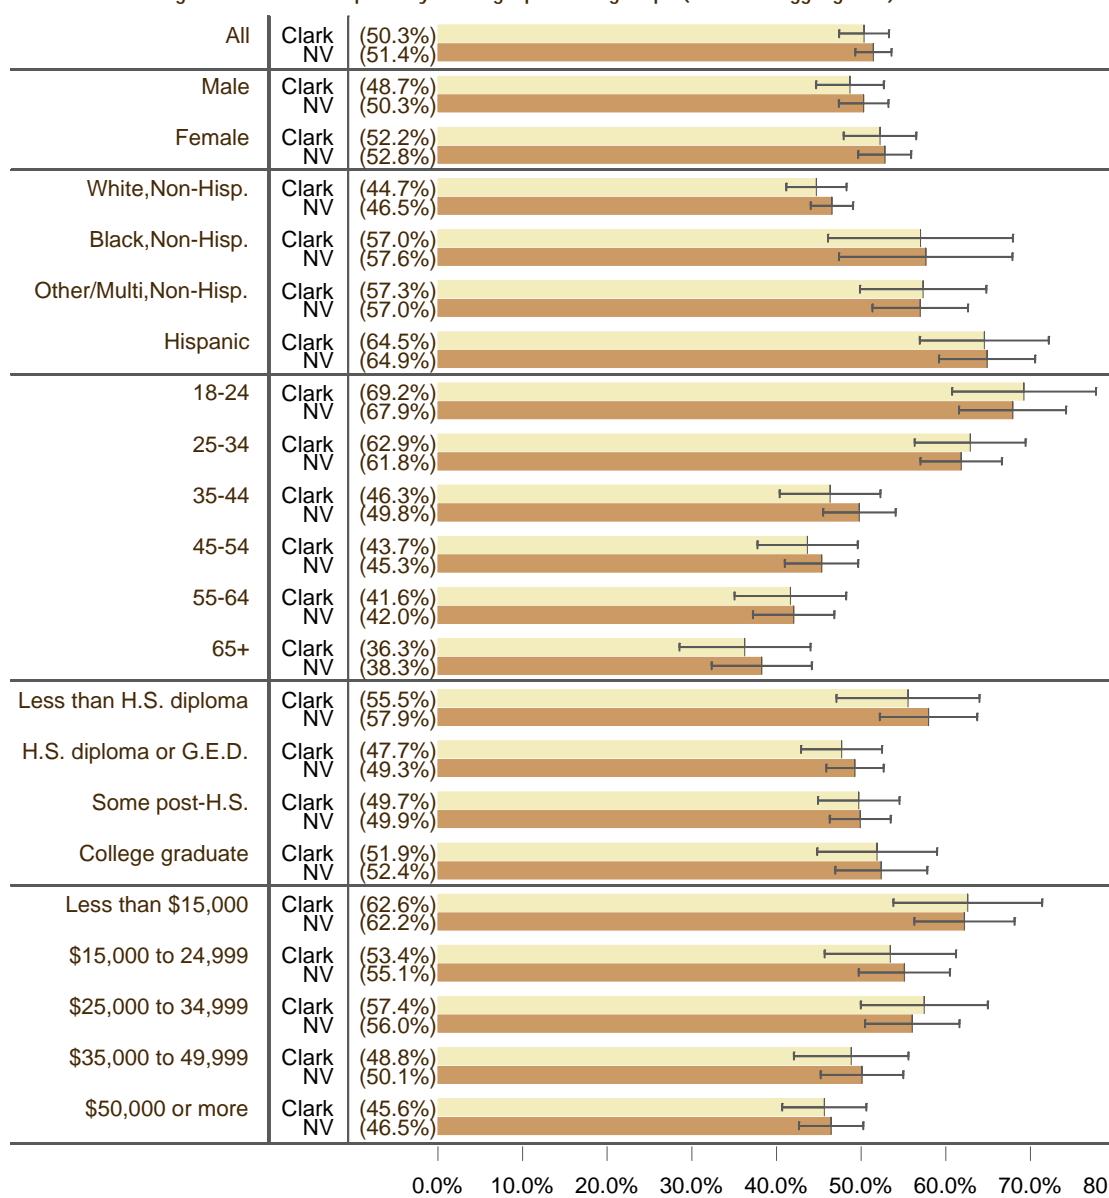

- Based on aggregated county data from 2000-06, about one-half of current smokers in the county stopped smoking for one day or longer in the past 12 months in attempts to quit smoking (Figure 34).

## Weight Status

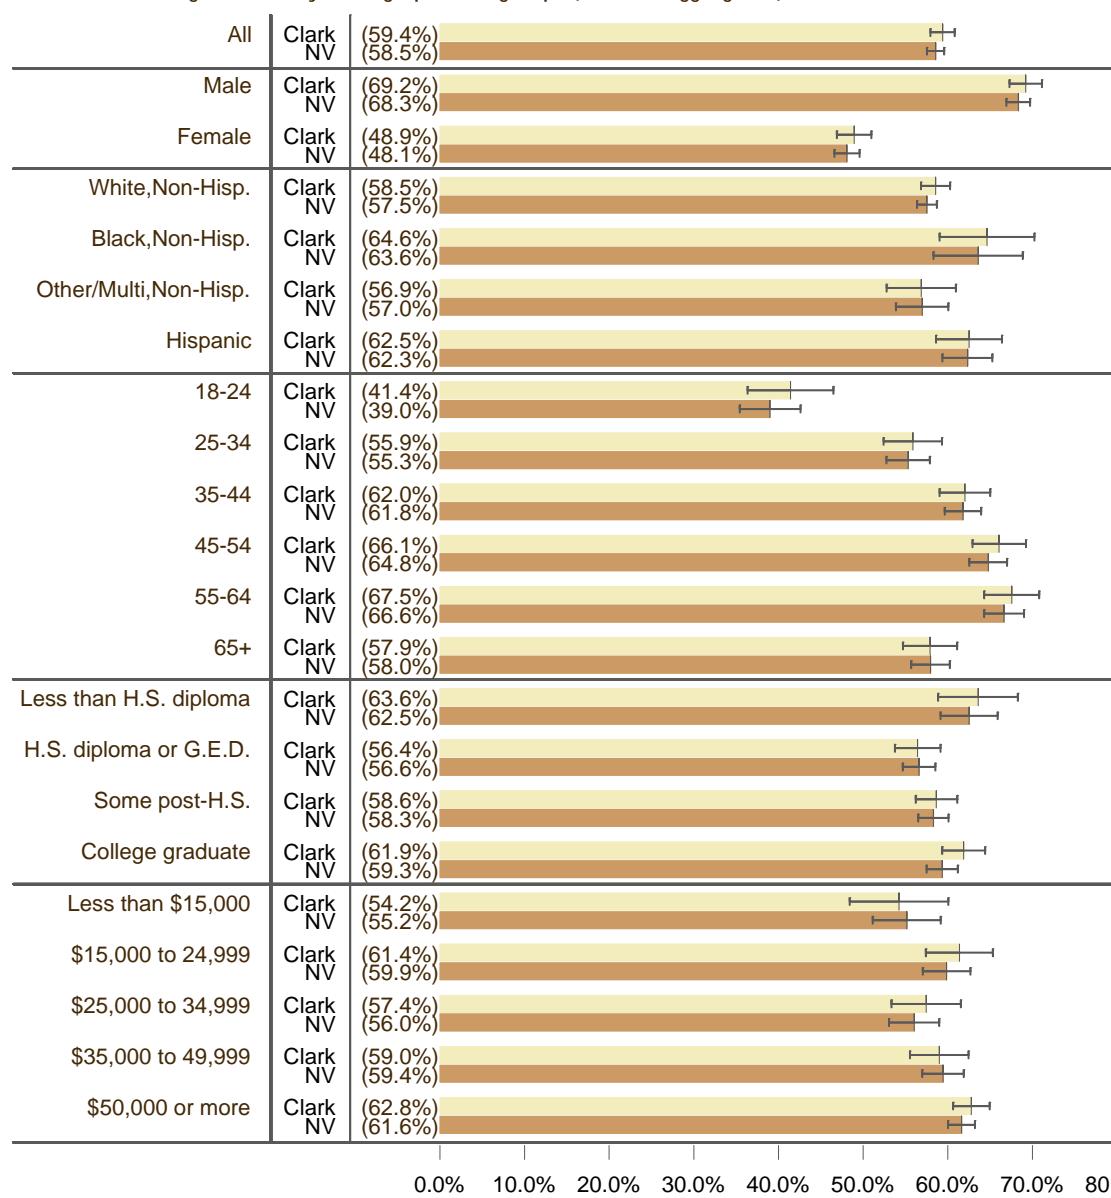

Indicator 1: Overweight or obese, defined as body mass index (BMI) greater than or equal to 25.

- 59.4% of county residents were either overweight or obese based on aggregated county data from 2000-06 (Figure 35).

**Indicator 2: Obese, defined as BMI greater than or equal to 30.**

- 21.9% of county residents were obese based on aggregated county data from 2000-06 (Figure 38).
- In both Clark County and Nevada, non-Hispanic blacks and Hispanics were more at risk for obesity than other racial/ethnic groups based on age-adjusted prevalence estimates (Table 64).

## Diabetes

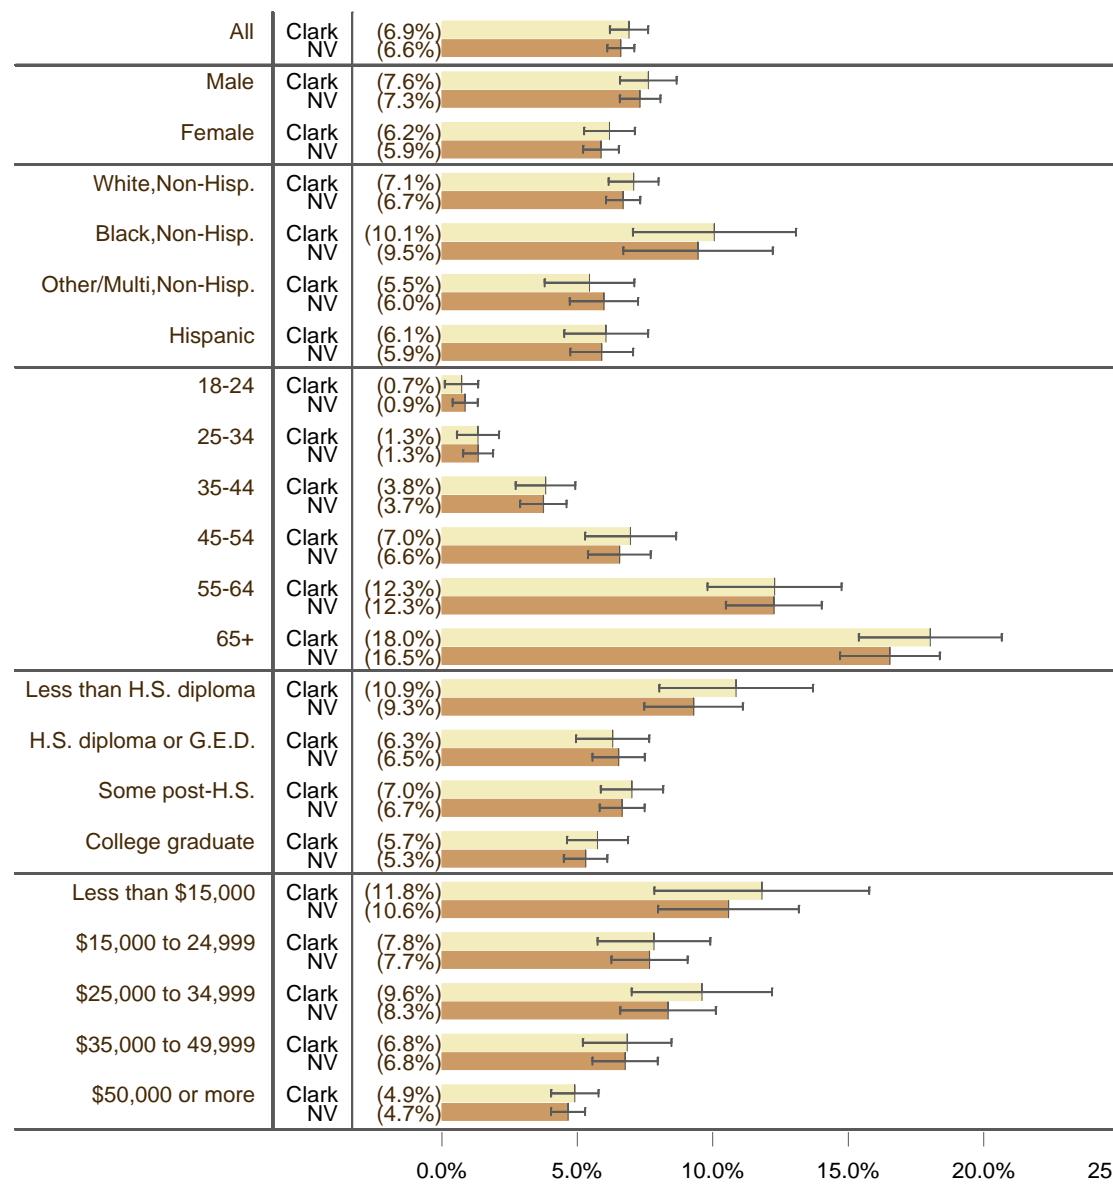

Indicator: Ever been told by a doctor, nurse or health professional that respondent has diabetes (borderline or pregnancy-related diabetes not included).

- 6.9% of county residents reported having diabetes based on aggregated county data from 2000-06 (Figure 41).
- In both Clark County and Nevada, non-Hispanic blacks and Hispanics were more at risk for diabetes than other racial/ethnic groups based on age-adjusted prevalence estimates (Table 69).

## Hypertension Awareness

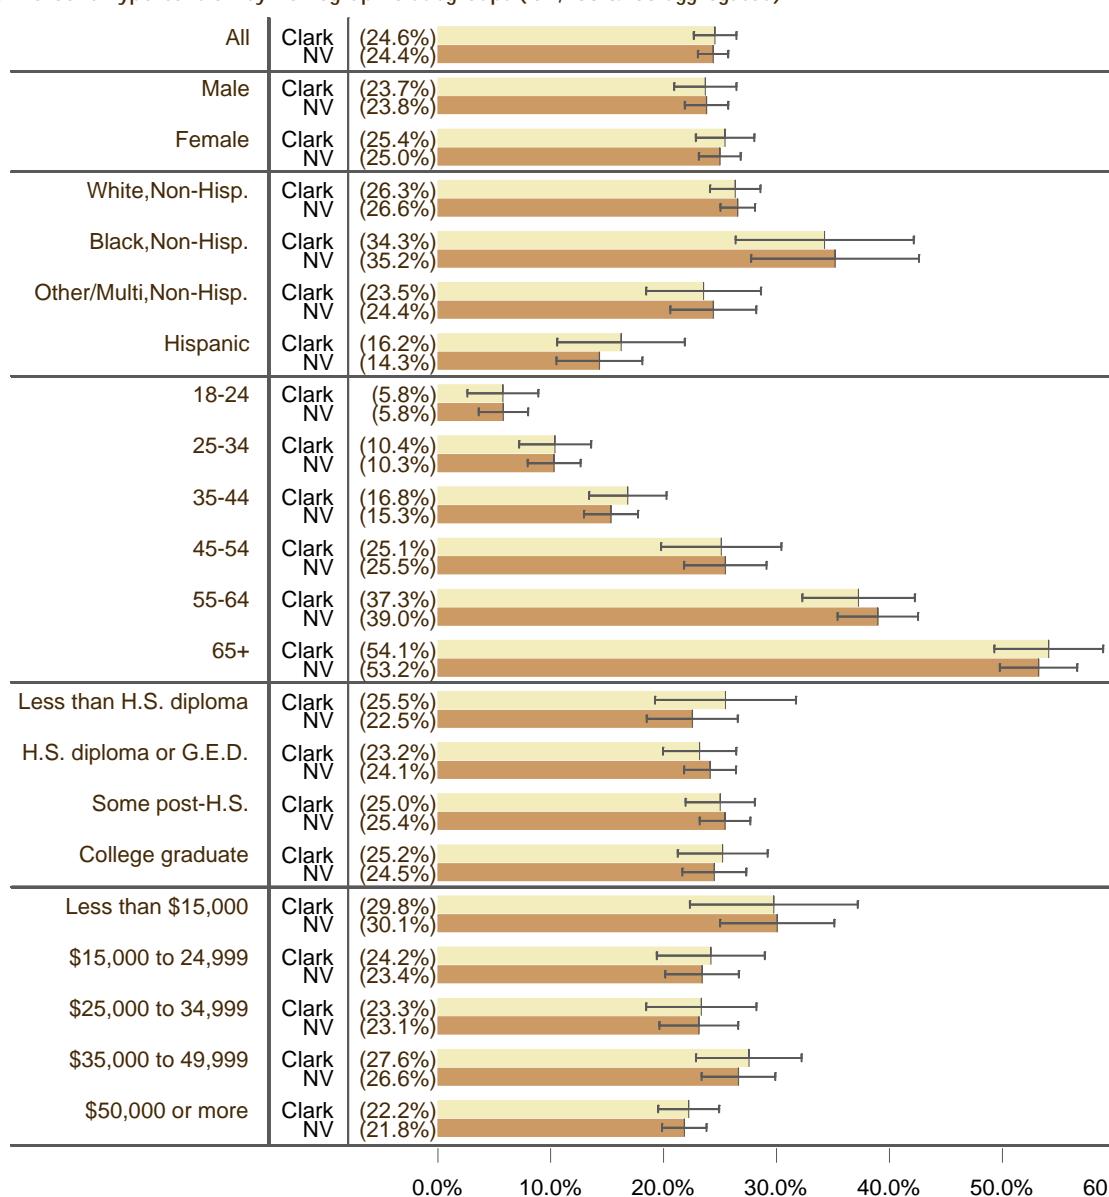

Indicator: Ever been told by a doctor, nurse or health professional that respondent has high blood pressure (borderline or pregnancy-related hypertension not included).

- 24.6% of county residents reported having high blood pressure based on aggregated county data from 2000-06 (Figure 44).
- Hypertension was more prevalent among non-Hispanic blacks than other racial/ethnic groups (Figure 44).

## Cholesterol Awareness

Indicator 1: Ever been told by a doctor, nurse or health professional that respondent's blood cholesterol is high.

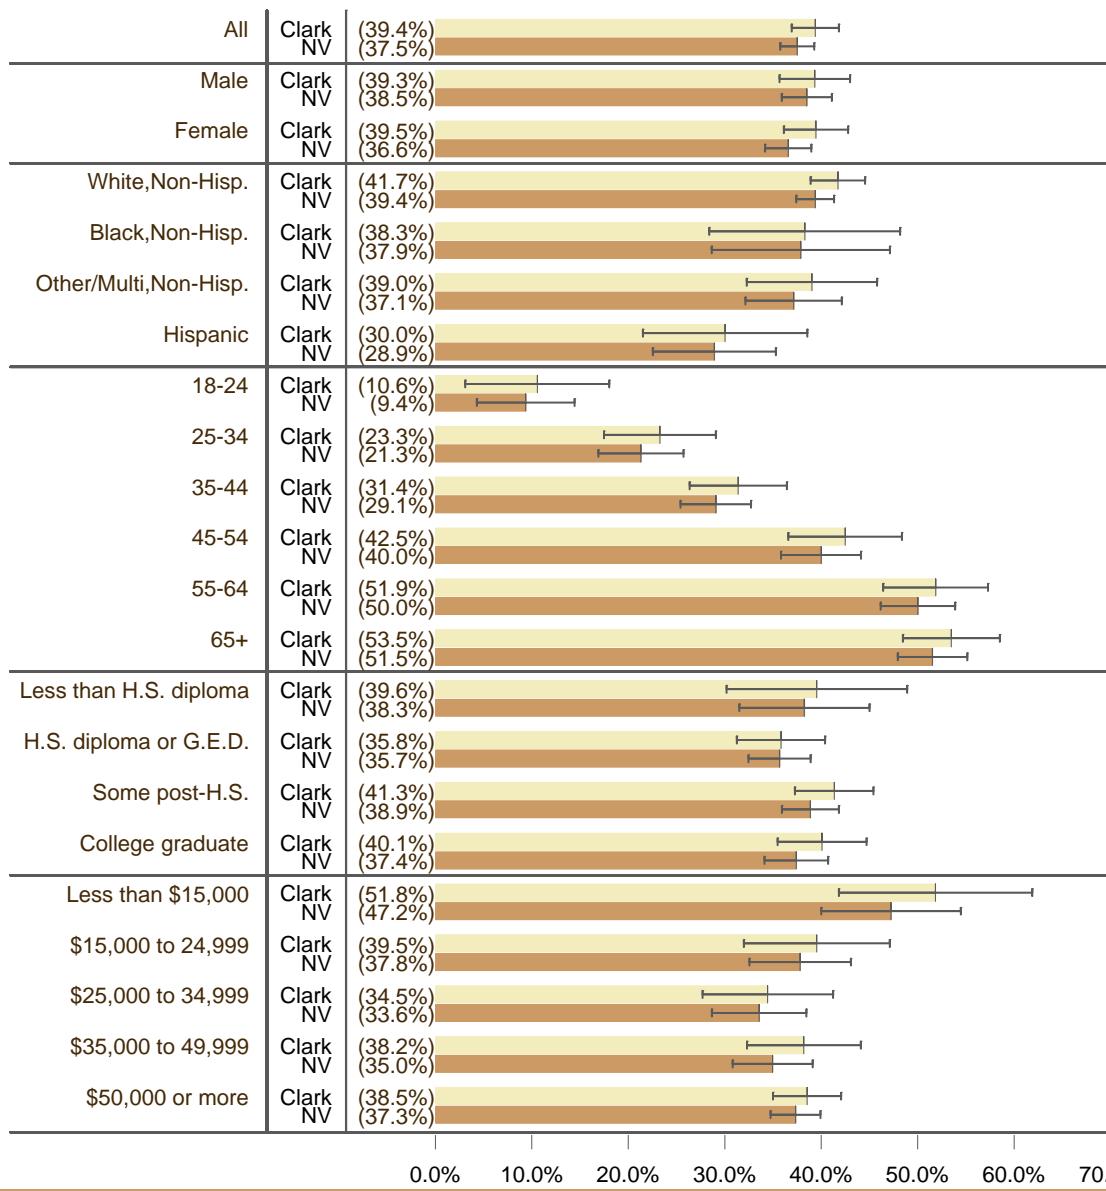

- 39.4% of county residents reported having high blood cholesterol based on aggregated county data from 2000-06 (Figure 47).

## A s t h m a

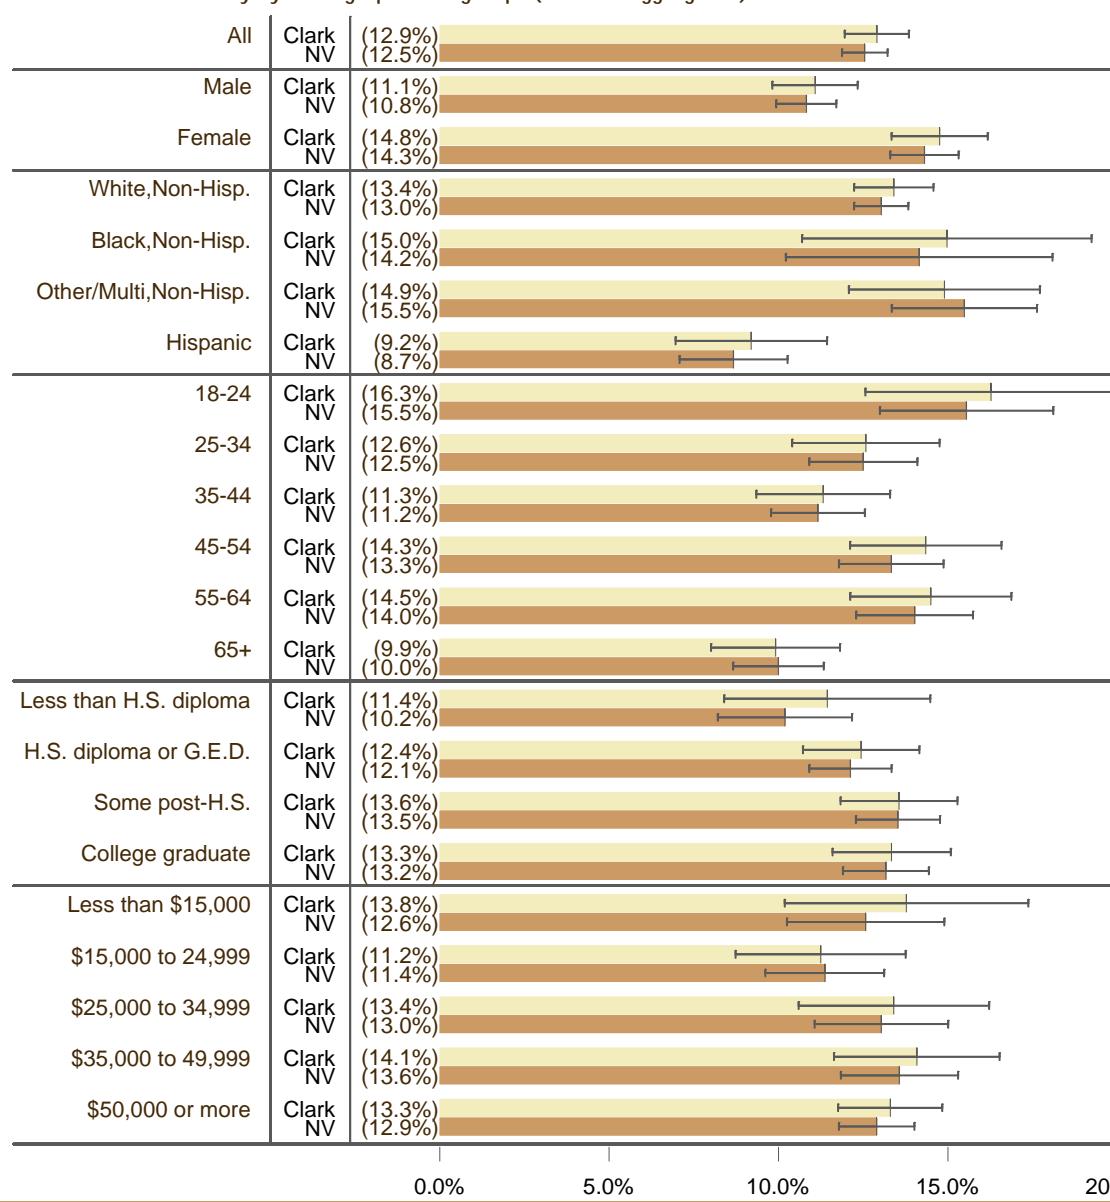

**Indicator 1: Ever been told by a doctor, nurse or health professional that respondent has asthma.**

- The estimated proportion of county adults who have been told they had asthma was 12.9% based on aggregated county data from 2000-06 (Figure 51).

## Cardiovascular Disease

Indicator: Cardiovascular disease or CVD, defined as present if an affirmative response was provided to any of the three BRFSS questions regarding the occurrences of heart attack or myocardial infarction, the occurrences of angina or coronary heart disease, and the occurrences of stroke.

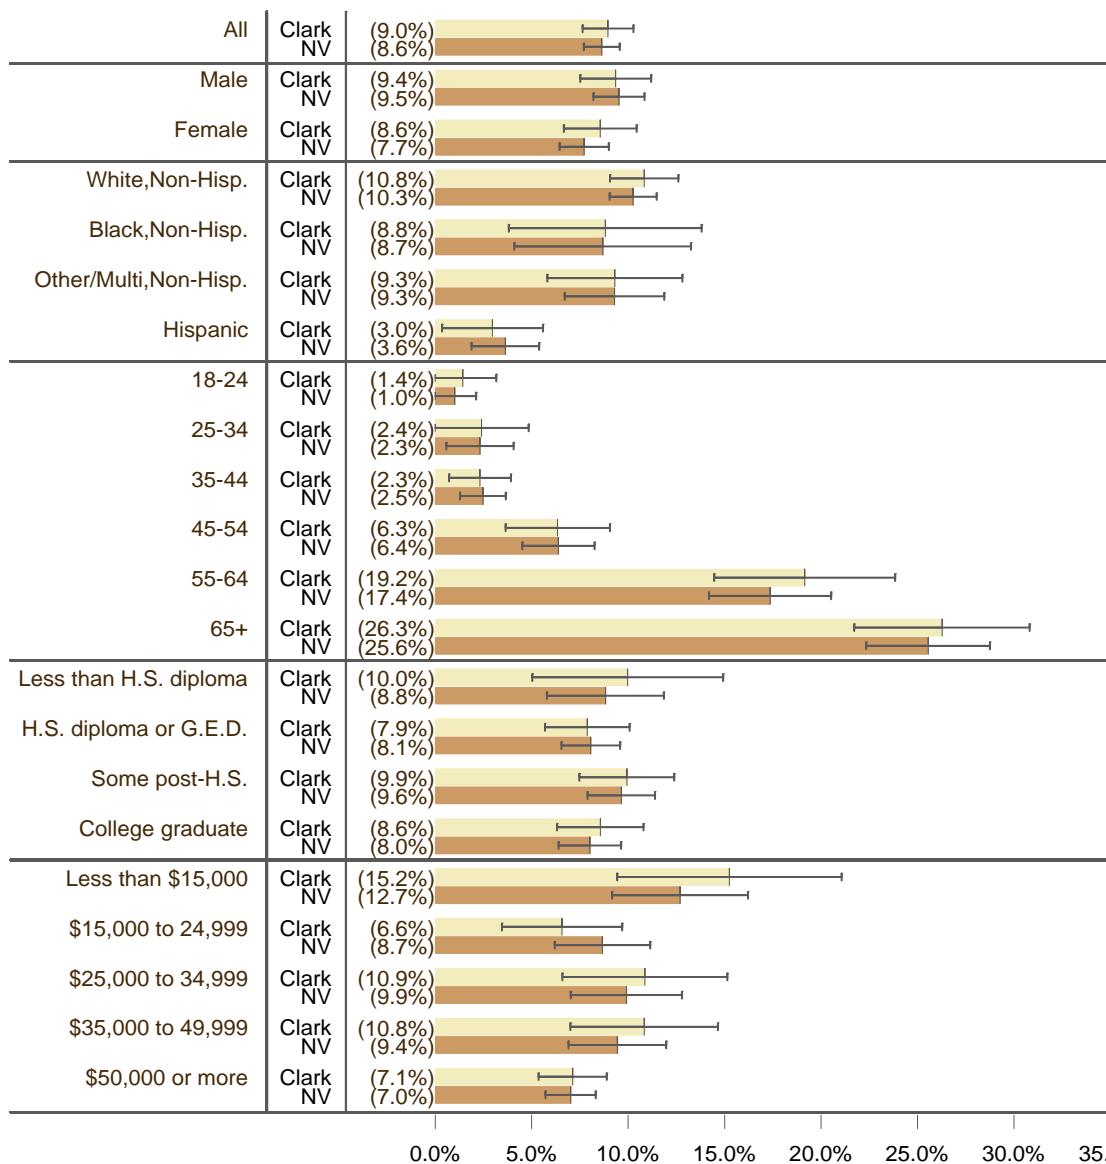

- The estimated proportion of county adults with CVD was 9.0% based on available data aggregated from 2000-06 (Figure 59).

## Cancer Awareness

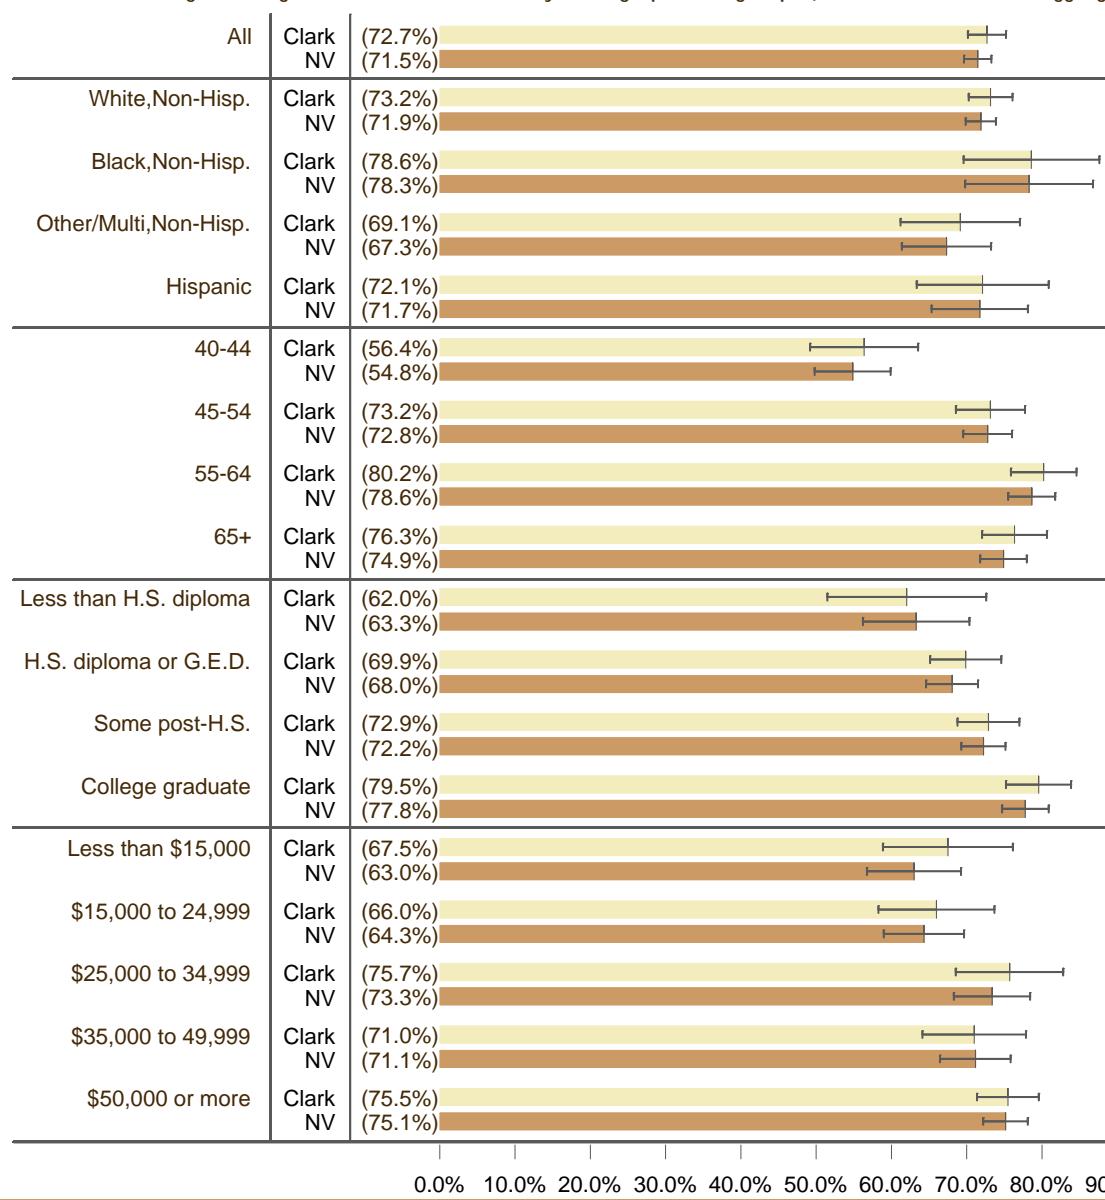

Indicator 1: Received mammogram within the past two years (among females aged 40+ years).

- Based on aggregated county data from 2000-06, 72.7% of women aged 40 years and older received a mammogram within the past two years (Figure 62).

Available from <http://wonder.cdc.gov/Bridged-Race-v2006.html>. (accessed in September 2007).

## Race and Ethnicity

Race and ethnicity are two different concepts and are often recorded separately in data collection. Commonly recognized racial groups in the U.S. include "white", "African American or black", "Asian, Native Hawaiian and other Pacific Islander", "American Indian, Alaska Native or Native American", etc. Most public health data also collect a minimum of two ethnicities: "Hispanic or Latino" and "not Hispanic or Latino". Unless otherwise indicated, this report adopted a racial/ethnic classification based on the combined status of race and ethnicity.

## Life Expectancy and Years of Potential Life Lost

Life expectancy estimates were calculated using population and mortality data of selected years for the county and the state. The abridged life tables were constructed according to the Chiang methodology (Chiang CL. *The Life Table and its Applications*. Malabar, Florida: Robert E. Krieger Publ. Co.; 1984.). Data were aggregated for 1993 to 1994, 1998 to 1999, and 2003 to 2004 to improve the accuracy of estimates. Life expectancy data were also used to calculate years of potential life lost (YPLL), another mortality measure that takes into account the remaining life expectancy at each age of death, or the number of years of life "lost" when a person dies from any cause. Since the number of potential years left to live is higher for premature or untimely deaths, YPLL gives more importance to deaths occurring at younger ages and is thus often used as an indicator of premature mortality. In addition, cause-specific YPLL provides a summary measure of the impact of certain causes of death on a population.

## Weighting and Data Aggregation

Statistical analyses were conducted on weighted BRFSS data using SAS software to account for the complex sampling designs.

Prevalence estimates computed from the BRFSS data are therefore, weighted estimates. Weighting of survey records is necessary to correct for the differences between the sample and the population from which the sample is taken. The weight applied to each BRFSS record is based on the probability of selection of a telephone number, the number of adults in a household, the number of phones in a household, and the respondent's age, gender and race/ethnicity to adjust for nonresponse and the distribution of adults by age, gender and race/ethnicity in each state. Therefore, prevalence estimates based on weighted BRFSS data are representative of the overall adult population in each state. At the national level however, prevalence estimates for BRFSS indicators were not computed from weighted national data. Instead, the median or mid-point estimate among participating states was adopted as the prevalence estimate for the nation. In addition to presenting annual prevalence estimates from 2000 to 2006, available BRFSS data from 2000 to 2006 were aggregated to produce more reliable estimates of prevalence for both the county and state.

## Prevalence and Incidence

All BRFSS indicators were reported in terms of prevalence, a measure of the extent of a condition in a population at a given point in time. In this report, prevalence estimates from weighted data were expressed in the form of percentages. The number of survey respondents with the condition of interest, denoted by "N" in the tabulated data, was also provided. Age adjustment or standardization of prevalence estimates was adopted in this report to control for differences in the age distribution of various populations. Age adjustment eliminates the impact of different age structures when comparing the health status of multiple populations at one point in time, or when comparing the health status of one population across time. All age-adjusted prevalence estimates presented in this report were standardized to the state's age distribution of the aggregated BRFSS data from 2000 to 2006.

In comparison, incidence is simply the number of new occurrences of a condition or an event (e.g. number of deaths or births) in a population over a period of time. As incidence counts are impacted by population size, incidence rates are often reported to adjust for changes or differences in population size. A crude or unadjusted incidence rate is the number of new occurrences of a condition or an event divided by the population at risk over a specific time period. Incidence rates thus calculated are generally multiplied by a constant such as 100,000 (or 1,000 for birth and infant mortality rates) for ease in comparison and reported as "per 100,000 population", or "per 100,000 population per year" as all incidence rates were reported per year in this report. Age standardization of incidence rates was also adopted in this report. All age-adjusted incidence rates presented in this report were adjusted to the 2000 U.S. standard population.

## Confidence Interval

Confidence intervals provide a means of assessing and reporting the precision of a point estimate (e.g. a prevalence estimate) by accounting for uncertainties that arise from the natural variations inherent in sampling. This report has used the standard 95% confidence level. This means that in 95 out of 100 cases, the estimated range between the lower and upper confidence limits contains the unknown population parameter (e.g. the true prevalence) which is never obtainable and can only be estimated. Computation of confidence intervals for prevalence estimates took into account the weighting of complex survey designs. While not equivalent to a formal test of statistical significance, differences in prevalence are considered to be significant if the confidence intervals do not overlap.

## Reliability of Estimates

The issue of reliability arises when rates and percentages have small numerators, as rates and percentages based on small numbers may fluctuate dramatically from year to year, or differ considerably across areas and demographic groups, even when there is no meaningful difference. Although data aggregation helps provide relatively stable estimates, and the provision of confidence intervals helps ensure that small differences will not be exaggerated, it is recommended that prevalence statistics be used with caution when the number of survey respondents per cell is smaller than 20 (currently the numerator threshold for statistical reliability used by the Mortality Module on CDC WONDER on-line database).
