

Clark County Health Status Report Volume II

About Volume II of the Health Status Report: In January 2007, the Southern Nevada Health District published Volume I of the Clark County Health Status Report, which provides information about Clark County's population as a whole, the various reportable communicable diseases and the extent to which they affect our population. Volume II of the Clark County Health Status Report is the second report in our series examining the health status of our community. It is intended to inform the community about health risk behaviors associated with non-communicable diseases and conditions that contribute to the leading causes of death and disability among county residents. This report examines indicators related to health status, health care access, health behaviors and outcomes.

June, 2007

The series of *Clark County Health Status reports* are available from: Southern Nevada Health District, Office of Epidemiology, PO Box 3902, 625 Shadow Lane, Las Vegas, NV 89127. The publications can also be accessed electronically at <http://www.southernnevadahealthdistrict.org>

Executive Summary

Background

The rapid growth and diversity of our population create challenges to improving the health status of our community. The population of Clark County has increased more than 70% for the past decade, and is projected to reach 3.3 million by 2026 (State Demographer's Estimates and Projections as of July 2006). Among all racial/ethnic groups, Hispanics had the fastest population growth, from 18% of the total population in 1996 to a projected 36% in 2026. This is accompanied by decreases in percentages of non-Hispanic white and black populations, projected to represent 46% and 9% of the total population respectively by 2026. As disparities in health behaviors and outcomes exist among racial/ethnic groups, the racial/ethnic diversity of our population is a key challenge facing community health promotion and disease prevention programs (Clark County Health Status Report 2000-2004, Volume I).

Lack of health insurance also contributes to the formidable task of improving community health status. From 2000 to 2005, the percentage of county adults reporting no insurance coverage of any kind has been consistently higher than national medians, and has increased significantly, from 13% in 2000 to 19% in 2005 (Health Care Access/Coverage Section). The disparity in health insurance coverage also remains a persistent problem, with Hispanics reporting the highest percentage of no insurance coverage among all racial/ethnic groups.

As with the rest of the nation, more county residents are living longer. Life expectancy of county residents increased from 74.8 years for those born in 1993 to 1994 to 76.7 years for those born in 2003 to 2004 (Clark County Health Status Report 2000-2004, Volume I). The challenge associated with increased life expectancy is to improve the

quality of life of older people, as older age is often associated with one's risk for many chronic diseases and degenerative illnesses, including the leading causes of death and disability. Although the risk of disease and disability increases with age, adopting healthier behaviors (e.g. regular physical activity, a smoke-free lifestyle and a healthy diet) and getting regular screenings for certain cancers and other conditions can help prevent many chronic diseases and conditions such as diseases of heart, cancer, stroke and diabetes, the nation's leading chronic disease killers.

Mortality Highlights

Overall

In 2003, the top four causes of death for all people in the United States were diseases of heart (28% of all deaths), cancer (23%), stroke (6%) and chronic lower respiratory diseases (5%) (Figure 1). The same four chronic diseases were also the leading causes of death among Clark County residents, accounting for more than 60% of all deaths. Other chronic diseases and conditions among the leading causes of death in the county included Alzheimer's disease, diabetes, chronic liver disease and cirrhosis, and essential hypertension and hypertensive renal disease. Compared with the rest of the nation, chronic lower respiratory diseases accounted for higher percentages of deaths among both county and state residents. Age-adjusted death rates (deaths per 100,000 population per year) for cancer and chronic lower respiratory diseases were also much higher in both the county and state than in the nation (Table 1).

Age, Gender and Race Variations

Unintentional injuries or accidents, assault (homicide) and legal intervention (legal execution by the police or other law-enforcing agents), and suicide were the top three leading causes of death among persons aged 10 to 24 years. In 2003, 74% of all deaths among county residents aged 10 to 24 years resulted from these causes (CDC WONDER Mortality Module).

Chronic diseases and conditions were the leading causes of death among older adults. In 2003, the leading chronic disease killers among county residents aged 55 years and older were diseases of heart (2,642 deaths in this age group or 27% of all deaths in this age group), cancer (2,454 deaths or 26%), chronic lower respiratory diseases (707 deaths or 7%), stroke (622 deaths or 6%), Alzheimer’s disease (196 deaths or 2%), diabetes (160 deaths or 2%), chronic liver disease and cirrhosis (81 deaths or 0.8%), essential hypertension and hypertensive renal disease (74 deaths or 0.8%) and Atherosclerosis (44 deaths or 0.5%) (CDC WONDER Mortality Module).

Diseases of heart and cancer were the top two causes of death for both sexes (all ages combined). In 2003, these two causes accounted for 51% of all deaths among male residents in the county, and 47% of all deaths among female residents in the county (Figure 2).

The same year’s mortality data showed that unintentional injuries and suicide accounted for higher percentages of death among males than among females, while chronic lower respiratory diseases, stroke and Alzheimer’s disease accounted for higher percentages of death among females than among males. The percentages of deaths due to chronic lower respiratory diseases, unintentional injuries and suicide were also higher for both sexes in the county than in the rest of the nation.

Compared with the rest of the nation, a higher percentage of deaths among whites (all ages combined) in the county was due to chronic lower respiratory diseases, accounting for 7% of all deaths in this racial group in 2003 (Figure 3). It was the third leading cause of death (after diseases of heart and cancer) for whites in both the county and state, and the fourth leading cause of death (after stroke) for whites in the nation. Among blacks (all ages combined), the percentages of deaths due to unintentional injuries and assault/legal intervention were higher in the county than in the rest of the nation. Of all racial groups (all ages combined), the percentage of deaths due to diabetes was also highest among blacks.

Table 1. Age-Adjusted Death Rates and Percentages of All Deaths by Selected Leading Cause of Death in Clark County, Nevada and United States, 2003

	Diseases of Heart	Malignant Neoplasms (Cancer)	Chronic Lower Respiratory Diseases	Cerebrovascular Diseases (Stroke)	Alzheimer’s Disease	Diabetes	Chronic Liver Disease and Cirrhosis	Essential Hypertension and Hypertensive Renal Disease
Age-Adjusted Death Rates (Deaths per 100,000 population per year):								
Clark	239.9	203.8	59.6	56.8	18.2	14.2	10.4	6.4
NV	241.8	202.3	62.4	56.7	18.9	15.0	12.0	7.2
US	232.3	190.1	43.3	53.5	21.4	25.3	9.3	7.4

*Percentages of all deaths of each racial group annotated on graphs with number of deaths by underlying cause of death in parentheses. In the case of different causes contributing to equal numbers of deaths, ranking was based on age-adjusted death rates.

(*)Percentages unreliable due to small counts of deaths in racial subgroups.

Health Status Highlights

Prevalence of Youth Risk Behaviors

Data from the 2005 Youth Risk Behavior Surveillance (YRBS) indicated that the percentages of high school students reporting suicidal attempts and certain illegal drug use were higher in the county than in the rest of the nation (Figure 4). Because risk behaviors that contribute to the leading causes of death among youth are often established during adolescence and extend into adulthood, interventions and policies aimed at preventing unintentional injury, violence, suicide and other risky health behaviors at young ages are critical for improving health outcomes among youth and overall community health status.

Burden of Chronic Diseases and Conditions among Older Adults

Data from the 2005 Behavioral Risk Factor Surveillance System (BRFSS) indicated that the percentage of adults reporting poor or fair health increased with age, from 6% among county adults aged 18 to 24 years to 24% among county adults aged 65 years and older. Older adults also reported many more physically unhealthy days than younger adults, due to the many chronic diseases and their related activity limitations that increase with age, such as diabetes, hypertension, high cholesterol, cardiovascular disease and cancer. These conditions often diminish one's quality of life as they can cause disability and loss of independence before resulting in death. In 2005, about one in five county adults aged 65 years and older reported having diabetes, one in four reported having some form of cardiovascular disease, and one in two reported having hypertension or high cholesterol (Figure 5). In addition to the hardships that chronic diseases impose on individuals and their families, these diseases are a major contributor to health care cost. It is estimated that the cost of providing health care for a person aged 65 years or older is three to five times greater than the cost for someone younger than 65 (CDC's Morbidity and Mortality Weekly Report, 2003/Vol. 52/No.6). It has also been projected that by year 2030, health care spending in the United States will increase by 25% (before inflation or new technologies being taken into account) simply because of the increase in lifespan and the growing burden of chronic diseases among older adults (Agency for Healthcare Research and Quality, CDC).

General Health Status and Health Insurance Coverage

Among county adults aged 18 years and older in 2005, 15% reported poor or fair health status, with Hispanics reporting a significantly higher percentage (27%) than other racial/ethnic groups (Health Status Section). Nineteen percent of county adults reported no insurance coverage of any kind in the same year (Health Care Access/Coverage Section). Lack of health insurance coverage was more prevalent among Hispanics (45%) than other racial/ethnic groups (11% among non-Hispanic whites and 30% among non-Hispanic blacks). The percentage of county adults reporting no insurance coverage was consistently higher than national medians from 2000 to 2005.

Racial/Ethnic Disparities in Disease Burden

The burden of many chronic diseases and conditions—especially hypertension, diabetes, cardiovascular disease and cancer—varies widely by race and ethnicity. For example, among county adults aged 18 years and older in 2000 to 2005, 35% of non-Hispanic blacks (BNH) had hypertension, compared with 16% of Hispanics and 27% of non-Hispanic whites (WNH) (Hypertension Awareness Section). Ten percent of BNH had diabetes, compared with 6% of Hispanics and 7% of WNH (Diabetes Section). Ten percent of WNH and 11% of BNH had some form of cardiovascular disease, compared with 5% of Hispanics (Cardiovascular Disease Section). Higher incidences of cancer were seen among WNH than other racial/ethnic groups. Among county residents in 2000 to 2003, WNH reported 542.4 new cancer cases per 100,000 population per year, compared with 473.2 new cases per 100,000 per year reported among BNH and 278.4 new cases per 100,000 per year reported among Hispanics (Cancer Section).

Executive Summary

Figure 4. Prevalence of Selected Youth Risk Behavior Indicators (%), 2005

		Prevalence (%)	
		Clark	US
Injuries and Violence	Rode with a drinking driver during the past month	24.4%	28.5%
	Drove when drinking during the past month	8.4%	9.9%
	Carried a weapon during the past month	14.8%	18.5%
	Were in a physical fight during the past year	32.8%	35.9%
	Attempted suicide during the past year	8.7%	8.4%
	Smoked cigarettes during the past month	17.4%	23.0%
Tobacco, Alcohol and Other Drug Use	Drank alcohol during the past month	38.8%	43.3%
	Engaged in episodic heavy drinking during the past month	21.3%	25.5%
	Used marijuana during the past month	17.9%	20.2%
	Used cocaine during lifetime	10.7%	7.6%
	Used inhalants during lifetime	14.2%	12.4%
	Used methamphetamines during lifetime	11.4%	6.2%
	Used illegal injection drugs during lifetime	4.4%	2.1%

*Median percentages among participating states adopted as prevalence at the national level.

The County Health Report Card

The tragedy with many chronic diseases and conditions is that they are often preventable. Avoiding unhealthy behaviors—smoking, poor diet and physical inactivity—and making use of preventive care and screening services can dramatically reduce one’s risk for many chronic diseases, including the leading causes of death. The challenge, and the opportunity, is to turn our knowledge of critical factors that protect and promote health into action. The 25 indicators presented in the county health report card (Table 2) help point the way to these opportunities. The report card shows the most current county level statistics for each indicator and relevant Healthy People 2010 Targets. Success in achieving these targets will require mobilization of community resources and coordinated activities to address the health challenges facing our population.

Scope of This Report

The report is divided into individual sections covering the following health topics: general health status, health care access/coverage, physical activity, fruit and vegetable consumption, alcohol consumption, tobacco use, weight status, diabetes, hypertension awareness, cholesterol awareness, asthma, disability, cardiovascular disease, cancer and youth risk behaviors.

The report provides a concise statistical picture of the burden of health problems and risk behaviors among county residents. Although it does not discuss specific programs for reducing these health problems, it provides guidance for public health professionals and policy makers in prioritizing the health needs of our population and in organizing activities to meet these needs. It is our hope that this report will spotlight areas where we have opportunities to improve public health.

Table 2. The County Health Report Card (Among Adults 18 Years and Older)

Indicator	2005 Statistics*		Healthy People 2010 Target	Target Met?
	Clark	Nevada		
Health Status				
1. Poor or fair health status	15.1%	17.2%	N/A	N/A
2. Physically unhealthy days (mean number of days in past month)	3.6	3.8	N/A	N/A
3. Frequent mental distress	8.3%	10.3%	N/A	N/A
Health Behaviors and Outcomes				
4. No leisure time physical activity in past month	26.3%	26.8%	20%	No
5. Sufficient moderate activity	50.6%	50.7%	30%	Yes
6. Sufficient vigorous activity	33.0%	32.6%	30%	Yes
7. Eating 5+ fruits/vegetables daily	22.0%	22.5%	50%#	No
8. Binge drinking	16.7%	17.6%	6%	No
9. Heavy drinking	6.4%	7.4%	N/A	N/A
10. Current smoking	23.8%	23.1%	12%	No

*All statistics reported in terms of prevalence (%) with the exception of indicator 2.

#Substituted by Healthy People 2000 Target as relevant Healthy People 2010 Target was not available (Healthy People 2010 segments the nutrition target into multiple categories of fruits and vegetables).

§ Based on available BRFSS data aggregated from 2000 to 2005 as data on some preventive care indicators were not available in 2005.

Major Data Sources

Behavioral Risk Factor Surveillance System (BRFSS)

http://www.cdc.gov/brfss/technical_infodata/surveydata.htm

CDC's BRFSS is an ongoing, state-based, random-digit-dialed telephone survey of the non-institutionalized U.S. civilian population aged 18 years and older. For the past two decades, it has helped states survey adults to learn about the wide range of personal behaviors that affect their health. This report used information gathered through this state-based survey system to describe personal health behaviors and outcomes in terms of how common they are, whether they are increasing over time, and which populations might be most at risk. Reporting data from BRFSS helps national, state and local public health agencies monitor the need for and the effectiveness of various public health interventions.

While the BRFSS is a useful tool for assessing the health of our population, it has at least four limitations. First, BRFSS excludes people who don't have land line telephones or are in institutions (e.g. nursing homes). Second, people who are severely impaired may not be adequately represented because of the functional capacity required to participate in the survey. Third, people who speak a primary language other than English or Spanish are excluded as the survey is commonly administered in English or Spanish. Fourth, the BRFSS data are all self-reported and therefore have not been confirmed by a health care provider.

Unless otherwise indicated, data used to calculate the prevalence of health behaviors and outcomes presented in this report were from the BRFSS (available up to year 2005 at the time this report was written). To capture the wide range of ages that fall within the "adult" category, the report grouped data into six age groups: 18-24, 25-34, 35-44, 45-54, 55-64, and 65 and above. In addition, data were broken down by gender, race/ethnicity, educational attainment, income status of household, and employment status, factors that can greatly influence a person's health status and health care.

Youth Risk Behavior Surveillance System (YRBS)

<http://www.cdc.gov/HealthyYouth/yrbs/data/index.htm>

The YRBS was developed by CDC in 1990 to monitor priority health risk behaviors that contribute to the leading causes of death, disability, and social problems among youth and adults in the United States. The YRBS includes national, state, and local school-based surveys of

representative samples of 9th through 12th grade students. These surveys are conducted every two years, usually during the spring semester. The national survey, conducted by CDC, provides data representative of high school students in public and private schools in the United States. The state and local surveys, conducted by state and local agencies, provide data representative of high school students in each state or local school district. Unlike data from the BRFSS, the national data from YRBS are not the aggregate of state or local datasets. The information gathered from YRBS can be used to measure progress and changes in youth risk behaviors, help determine the health and educational needs of our youth, and guide activities to address these needs.

Data used to calculate the prevalence of selected youth risk behaviors in this report were from both the local and national YRBS (available up to year 2005 at the time this report was written). In addition to presenting the overall prevalence, data were broken down by gender, grade and race/ethnicity.

CDC WONDER Mortality Module

<http://wonder.cdc.gov/mortSQL.html>

Unless otherwise indicated, mortality statistics presented in this report were based on data from the CDC WONDER Mortality Module (available up to year 2003 at the time this report was written), an interactive database containing mortality counts for all U.S. counties.

National Program of Cancer Registry (NPCR)

<http://wonder.cdc.gov/cancer.html>

Cancer incidence statistics at the national level were based on incidence data from the interactive database of NPCR (available up to year 2002 at the time this report was written).

Nevada Interactive Health Database System (NIHDS)

http://health.nv.gov/index.php?option=com_content&task=view&id=27&Itemid=62

County and state level cancer incidence statistics were based on data from the Cancer Module of NIHDS (available up to year 2003 at the time this report was written); hospital discharge statistics related to cardiovascular disease and cancer were based on data from the Hospital Discharge Module of NIHDS (available up to year 2005 at the time this report was written).

Technical Notes

Weighting and Data Aggregation

Statistical analyses were conducted on weighted BRFSS and YRBS data using SAS software to account for the complex sampling designs. Prevalence estimates computed from BRFSS and YRBS data are therefore, weighted estimates. Weighting of survey records is necessary to correct for the differences between the sample and the population from which the sample is taken.

The weight applied to each BRFSS record is based on the probability of selection of a telephone number, the number of adults in a household, the number of phones in a household, and the respondent's age, gender and race/ethnicity to adjust for nonresponse and the distribution of adults by age, gender and race/ethnicity in each state. Therefore, prevalence estimates based on weighted BRFSS data are representative of the overall adult population in each state. At the national level however, prevalence estimates for BRFSS indicators were not computed from weighted national data. Instead, the median or mid-point estimate among participating states was adopted as the prevalence estimate for the nation. In addition to presenting annual prevalence estimates from 2000 to 2005, available BRFSS data from 2000 to 2005 were aggregated to produce more reliable estimates of prevalence for both the county and state.

Weighting of the national, state and local YRBS data adjusts for student nonresponse and the distribution of students by grade, gender and race/ethnicity in each jurisdiction. At the national level, prevalence estimates for YRBS indicators were computed from weighted national data.

For more information about BRFSS and YRBS data processing, visit <http://www.cdc.gov/brfss/> and <http://www.cdc.gov/HealthyYouth/yrbs/>.

Prevalence and Incidence

All BRFSS and YRBS indicators were reported in terms of prevalence, a measure of the extent of a condition in a population at a given point in time. In this report, prevalence estimates from weighted data were expressed in the form of percentages. The number of survey respondents with the condition of interest, denoted by "N" in the tabulated data, was also provided.

In comparison, incidence is simply the number of new occurrences of a condition or an event (e.g. new cancer cases, hospital discharges, deaths) in a population over a period of time. As incidence counts

are impacted by population size, incidence rates are often reported to adjust for changes or differences in population size.

Crude and Age-Adjusted Rates

A crude or unadjusted incidence rate is the number of new occurrences of a condition or an event (death in the case of death rate) divided by the population at risk over a specific time period. Rates thus calculated are generally multiplied by a constant such as 100,000 for ease in comparison and reported as "per 100,000 population", or "per 100,000 population per year" as all rates were reported per year in this report. Age adjustment or standardization of incidence or death rates was adopted in this report to control for differences in the age distribution of various populations. Age adjustment eliminates the impact of different age structures when comparing the health status of multiple populations at one point in time, or when comparing the health status of one population across time. All age-adjusted rates presented in this report were adjusted to the 2000 U.S. standard population.

Confidence Interval

Confidence intervals provide a means of assessing and reporting the precision of a point estimate (e.g. a prevalence estimate) by accounting for uncertainties that arise from the natural variations inherent in sampling. This report has used the standard 95% confidence level. This means that in 95 out of 100 cases, the estimated range between the lower and upper confidence limits contains the unknown population parameter (e.g. the true prevalence) which is never obtainable and can only be estimated. Computation of confidence intervals for prevalence estimates took into account the weighting of complex survey designs. While not equivalent to a formal test of statistical significance, differences in prevalence are considered to be significant if the confidence intervals do not overlap.

Reliability of Estimates

The issue of reliability arises when rates and percentages have small numerators, as rates and percentages based on small numbers may fluctuate dramatically from year to year, or differ considerably across areas and demographic groups, even when there is no meaningful difference. Although data aggregation helps provide relatively stable estimates, and the provision of confidence intervals helps ensure that small differences will not be exaggerated, it is recommended that prevalence statistics be used with caution when the number of survey respondents per cell is smaller than 20 (currently the numerator threshold for statistical reliability used by WONDER Mortality Module).

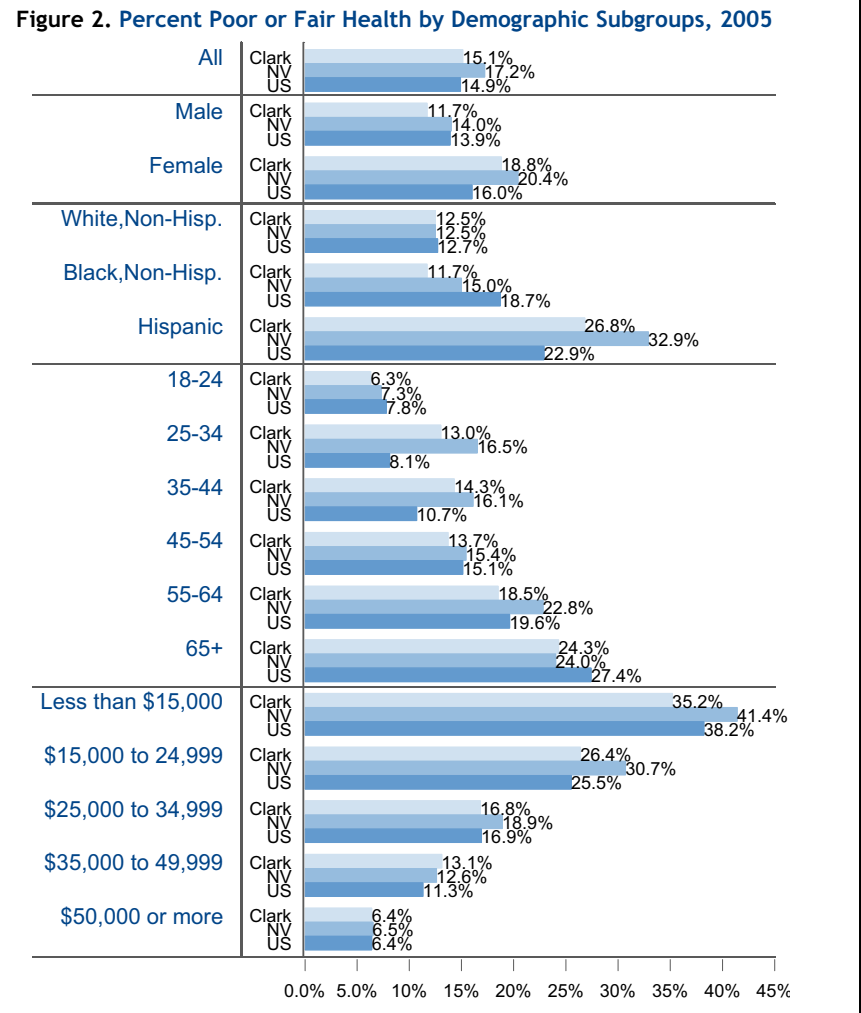

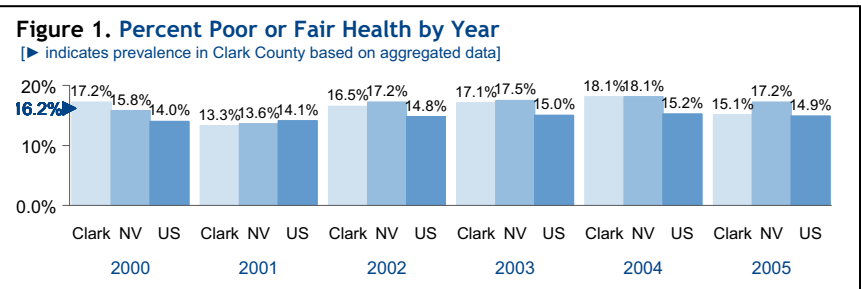

Individual Sections

Health Status

Indicator 1: Self-perceived health status, rated from excellent, very good, good, fair to poor.

- About 16% of county residents rated their overall health status as poor or fair, based on aggregated county data from 2000-2005 (Table 1). A lower percentage of self-reported poor or fair health was seen in the rest of the nation for the same period (Figure 1).
- Women were more likely to report poor or fair health than men in both the county and nation.
- Hispanics reported the highest percentage of poor or fair health among all racial/ethnic groups.
- Self-reports of poor or fair health status increased significantly with age, which is attributable to a high prevalence of chronic diseases and their related activity limitations among older adults.
- Self-perceived health status improved with income status and educational level.

Indicator 2: Physically unhealthy days, defined as the overall number of days during the previous 30 days when self-reported physical health (including physical illness and injury) was not good.

- The mean number of physically unhealthy days in the last 30 days reported by county residents was 3.6 days based on aggregated county data from 2000-2005 (Table 2).
- Women reported roughly two more unhealthy days per month than men.
- The average number of physically unhealthy days in the last 30 days increased significantly with age, from 1.9 days among those aged 18-24 years to 5.7 days among those aged 65 and older.
- Higher level of household income and educational status were associated with fewer unhealthy days.

Indicator 3: Frequent mental distress (FMD), defined as reporting 14 or more days in the past 30 days when mental health was not good because of stress, depression and problems with emotions.

The 14-day minimum period was selected because a similar period is often used by health care providers and researchers as a marker for clinical depression and anxiety disorders.

- About 11% of county residents reported having FMD based on aggregated county data from 2000-2005 (Table 3).
- Women were more likely to report FMD than men.
- Unlike physical health which worsens as one gets older, mental health appeared to improve with age for older adults. This improvement may be attributable to more personal/social resources, better coping skills and stronger social supports among older adults.
- The presence of FMD varied significantly by income level. FMD was less frequently reported among individuals with higher household income.

Health Care Access / Coverage

Indicator: Self-reported health care coverage including health insurance, prepaid plans and governmental plans.

- About 19% of county residents reported having no health insurance of any kind based on aggregated county data from 2000-2005 (Table 4). The percentage of adults in both the county and state reporting no insurance coverage was consistently higher than national medians of the same period (Figure 7).
- Hispanics reported a significantly higher percentage of no insurance coverage than other racial/ethnic groups.
- Access to health care improved with age, income and educational status.
- Self-reports of no insurance coverage among county residents increased significantly, from 12.9% in 2000 to 19.1% in 2005.

Physical Activity

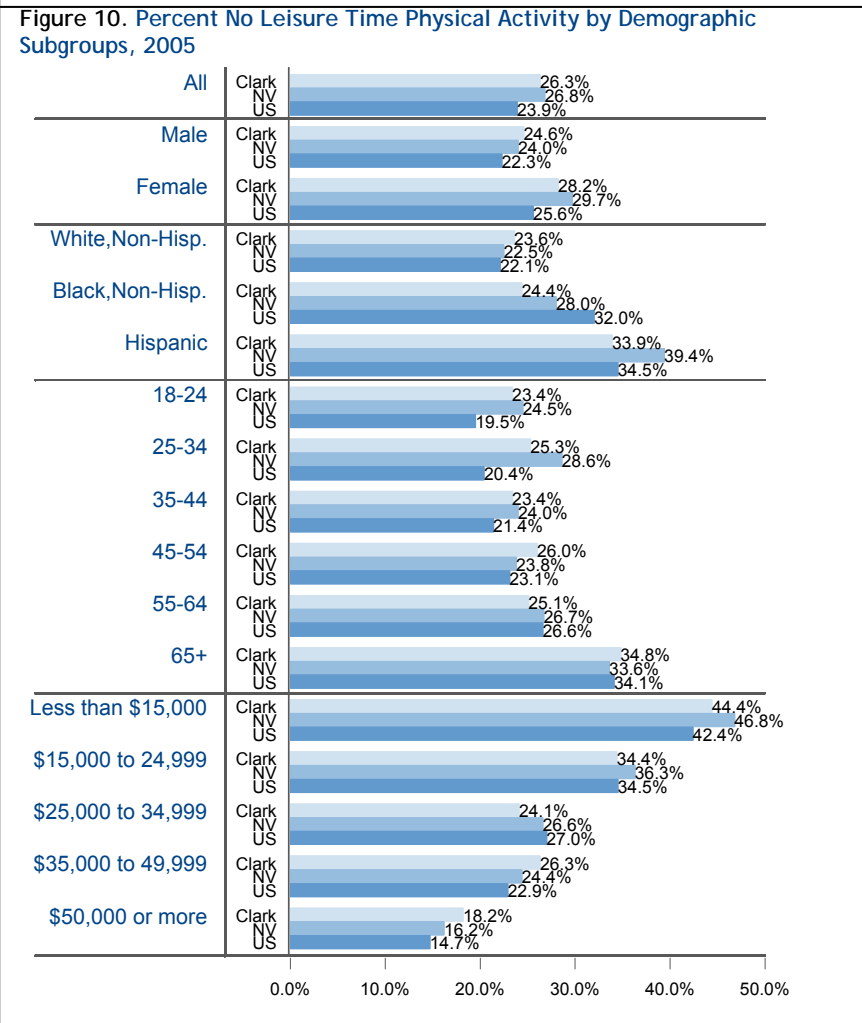

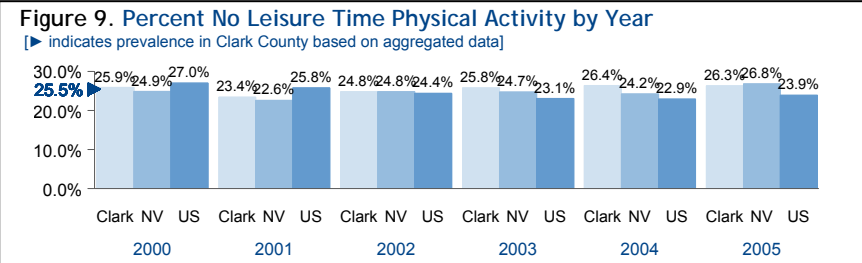

Regular physical activity can help prevent or control many of the health problems including obesity, arthritis, hypertension, diabetes, osteoporosis, stroke, depression and certain types of cancer.

Indicator 1: Self-reported leisure time physical activities or exercises in the past 30 days.

- The Healthy People 2010 target—reducing the proportion of adults who engage in no leisure time physical activity to 20%—was not met locally. About 26% of county residents reported having no leisure time physical activity or exercise based on aggregated county data from 2000-2005 (Table 5). The percentage of adults in both the county and state reporting no leisure time activity slightly increased during the time period (Figure 9).
- Lack of leisure time activities was more prevalent among women than men, and among Hispanics than other racial/ethnic groups.

Indicator 2: Self-reports of 30 or more minutes of moderate physical activity per day on five or more days per week, or vigorous activity for 20 or more minutes per occasion on three or more days per week.

- The Healthy People 2010 objective—increasing the proportion of adults who engage regularly, preferably daily, in moderate physical activity for at least 30 minutes per day to 30%—appeared to have been met locally. Based on aggregated county data, about one-half of county residents engaged in moderate physical activity for at least 30 minutes five or more days per week, or vigorous physical activity for 20 or more minutes three or more days per week, while about one-half did not (Table 6).

Indicator 3: Self-reports of 20 or more minutes of vigorous activity per occasion on three or more days per week.

- The Healthy People 2010 objective—increasing the proportion of adults who engage in vigorous physical activity that promotes the development and maintenance of cardio-respiratory fitness three or more days per week for 20 or more minutes per occasion to 30%—appeared to have been met locally. Based on aggregated county data, about 30% of county residents engaged in sufficient vigorous physical activity as recommended, while about 70% did not (Table 7).

Fruit & Vegetable Consumption

Eating a diet rich in fruits and vegetables can help reduce the risk of many cancers and other chronic conditions such as cardiovascular disease and diabetes.

Indicator: Eating five or more servings of fruits and vegetables daily.

- About 78% of county residents reported eating less than five daily servings of fruits and vegetables, based on aggregated county data (Table 8).
- The Healthy People 2000 nutrition target of increasing the proportion of adults eating five or more fruits and vegetables per day to 50% was not met, as it was achieved by only about 22% of county adults in 2005 (Figure 15).

Alcohol Consumption

Excessive alcohol use, either in the form of binge drinking, or heavy drinking, can lead to increased risk of health problems such as liver disease or unintentional injuries. Alcohol and tobacco used together also increase the risk for oral and throat cancers.

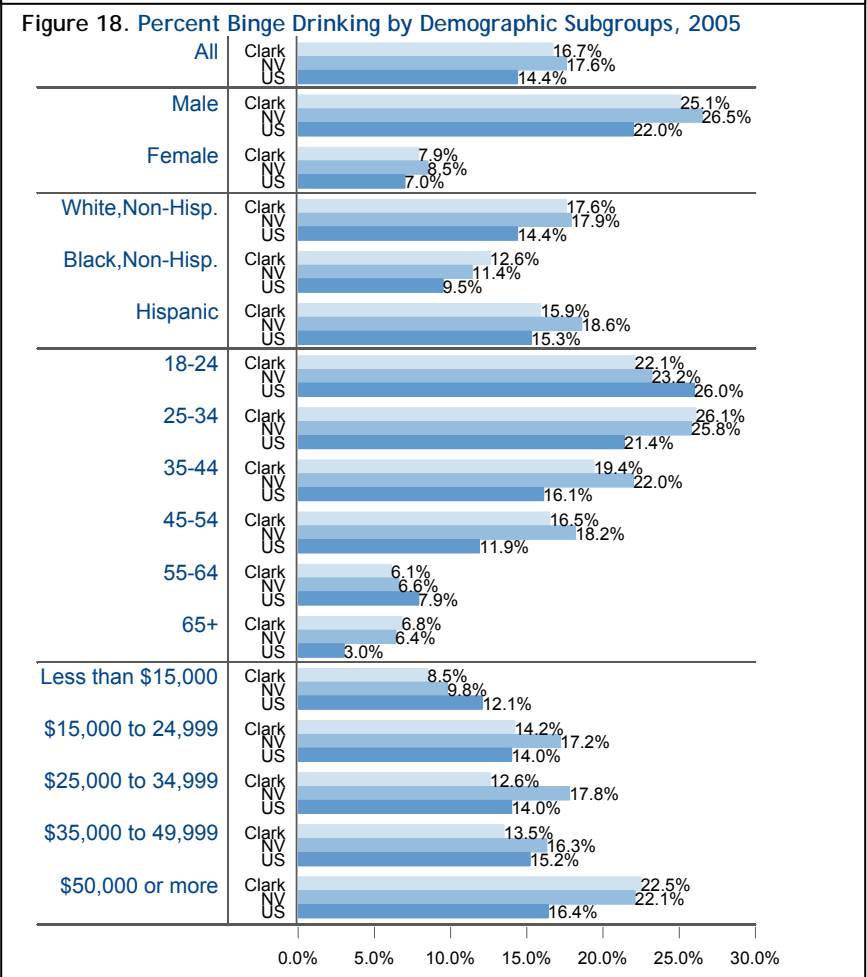

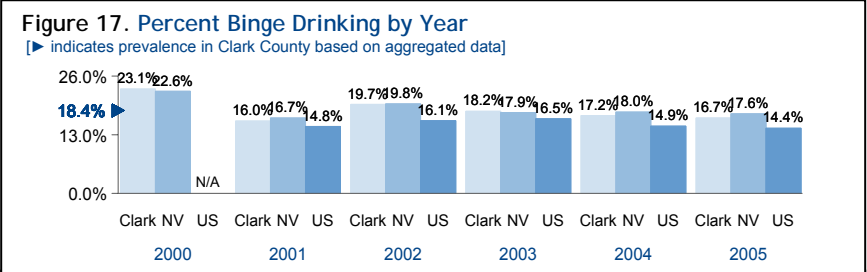

Indicator 1: Binge drinking, defined as having five or more drinks on one or more occasions in the past 30 days.

- The prevalence of binge drinking among county residents was 18% based on aggregated county data from 2000-2005 (Table 9). The Healthy People 2010 objective of reducing the proportion of adults aged 18 years and older engaging in binge drinking during past month to 6% was not met locally. Binge drinking was more prevalent in the county and state than in the rest of the nation (Figure 17).
- More males than females engaged in binge drinking.
- Adults aged 18 to 34 years were more likely than other age groups to engage in binge drinking.

- Prevalence of binge drinking varied little by educational attainment or income level. Individuals with higher household income however, were more likely to binge drink.

Indicator 2: Heavy drinking, defined as drinking more than two drinks per day on average for men or more than one drink per day on average for women.

- The prevalence of heavy drinking among county residents was 7% based on aggregated county data from 2000-2005 (Table 10). Heavy drinking was more prevalent in the county and state than in the rest of the nation (Figure 19).
- More males than females engaged in heavy drinking.
- Young adults aged 18 to 24 years were more likely than other age groups to engage in heavy drinking.

Tobacco Use

Lung/bronchus cancer is the leading cause of cancer deaths in both Clark County and Nevada. Smoking cessation can greatly reduce one's risk of developing lung and other cancers, heart disease, stroke, and chronic lung disease.

Indicator 1: Smoke everyday or some days currently.

- The prevalence of current smokers among county residents was 26% based on aggregated county data from 2000-2005 (Table 11). The Healthy People 2010 objective of reducing cigarette smoking by adults aged 18 years and older to 12% was not met locally. Tobacco use by adults was more prevalent in the county and state than in the rest of the nation (Figure 21). However, the prevalence of current smokers among county residents has declined since 2000.
- Hispanics were less likely to smoke compared with other racial/ethnic groups.

- The prevalence of tobacco use varied by educational attainment and income. Individuals with lower educational attainment and household income were at increased risk for tobacco use.
- In 2005, the prevalence of current smokers was highest among adults aged 45 to 54 years (31.2%), and lowest among adults aged 65 years and older (14.5%).

Indicator 2: Stopped smoking one day or longer in the past 12 months because of cessation attempts.

- Based on aggregated county data from 2000-2005, about one-half of current smokers in the county stopped smoking for one day or longer in the past 12 months in attempts to quit smoking (Table 12). However, the Healthy People 2010 objective of increasing smoking cessation attempts by adult smokers to 75% was not met locally.
- A higher proportion of younger adults made smoking cessation attempts than older adults did.

Weight Status

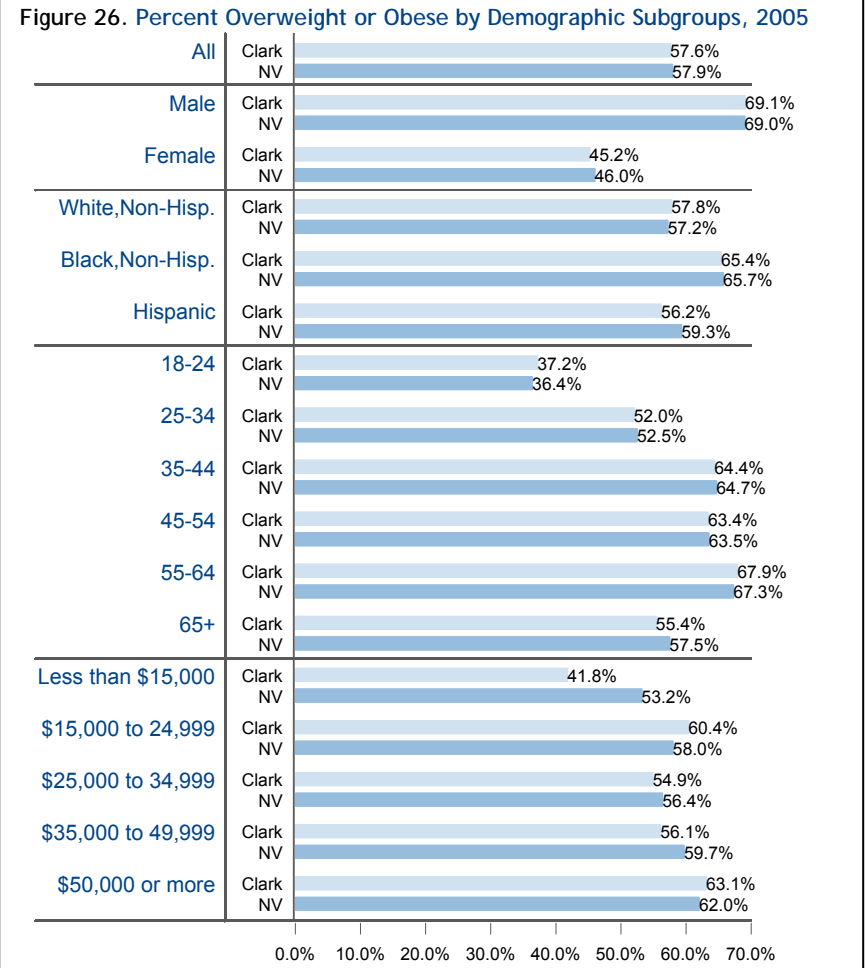

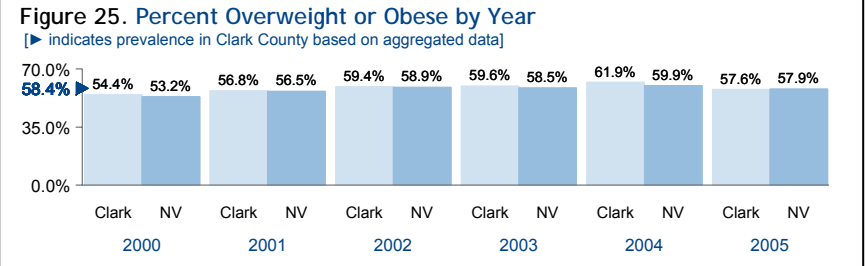

Obesity is associated with a greater risk of chronic diseases such as cardiovascular disease and diabetes. Obesity can also worsen conditions such as arthritis. The Healthy People 2010 objectives call for increasing the proportion of adults who are at a healthy weight (defined as BMI greater than or equal to 18.5 and less than 25) to 60%.

Indicator 1: Overweight or obese, defined as body mass index (BMI) greater than or equal to 25.

- The prevalence of overweight or obesity was 58% based on aggregated county data from 2000-2005 (Table 13).
- The prevalence of overweight or obesity among county adults increased slightly from approximately 54% in 2000 to 58% in 2005 (Figure 25).

Indicator 2: Overweight only, defined as BMI greater than or equal to 25 and less than 30.

- The prevalence of adults who are overweight but not obese as defined by BMI varied little from 2000 to 2005 in the county (Figure 27). Based on aggregated county data from 2000 to 2005, the prevalence was 37% (Table 14).

Indicator 3: Obese, defined as BMI greater than or equal to 30.

- About 21% of adults were obese based on aggregated county data from 2000 to 2005 (Table 15). The Healthy People 2010 objective of reducing the proportion of adults who are obese to 15% was not met locally.
- The prevalence of obesity increased slightly in the county from approximately 18% in 2000 to 21% in 2005 (Figure 29).
- Based on aggregated county data, obesity was more prevalent among non-Hispanic blacks than other racial/ethnic groups, and among individuals with lower income and educational attainment (Table 15).

Diabetes

Indicator: Ever been told by a doctor, nurse or health professional that respondent has diabetes (pregnancy-related not included).

- Diabetes was the sixth leading cause of death in the United States, accounting for 3% of all deaths in 2004 (National Vital Statistic Reports, 2006). In the county, diabetes was the 11th leading cause of death in 2004, accounting for 166 deaths or 1.4% of all deaths among county residents (Nevada Interactive Health Database System).
- The estimated proportion of county adults who have been told they had diabetes was 6.7% based on aggregated county data from 2000-2005 (Table 16).
- Diabetes was most commonly seen in older adults. Based on aggregated county data, the percentage of adults with diabetes increased from 0.9% among those aged 18 to 24 years, to 17.3% among those 65 years and older.
- A higher proportion of adults with diabetes were seen among non-Hispanic blacks, and among individuals with lower income and educational attainment.

Hypertension Awareness

The risk of hypertension increased with age, like many other chronic diseases and conditions. However, the consequences of aging are not inevitable. Adopting healthier behaviors—regular physical activity, a healthy diet and a smoke-free life style—can dramatically reduce one’s risk for hypertension and many other chronic diseases.

Indicator: Ever been told by a doctor, nurse or health professional that respondent has high blood pressure (pregnancy-related not included).

- The overall prevalence of hypertension among county adults was approximately 25% based on aggregated county data (Table 17). The Healthy People 2010 objective of reducing the proportion of adults with high blood pressure to 16% was not met locally.
- The prevalence of hypertension varied by race/ethnicity. Based on aggregated county data, non-Hispanic blacks had a higher prevalence (34.6%) than other racial/ethnic groups. The prevalence of hypertension was lowest among Hispanics (16.2%).

Cholesterol Awareness

Maintaining a healthy life style helps lower one's blood cholesterol level, prolong and improve health-related quality of life, and reduce the risk of heart attack or stroke.

Indicator: Ever been told by a doctor, nurse or health professional that respondent's blood cholesterol is high.

- The estimated proportion of county adults who have been told they have high blood cholesterol was approximately 40% based on aggregated county data (Table 18). The percentage of adults with high blood cholesterol in both the county and state was consistently higher than national medians (Figure 35).
- Blood cholesterol level increased significantly with age. Because high serum cholesterol is a major risk factor for cardiovascular disease, periodic cholesterol screening is an essential component of preventive health care. The Healthy People 2010 objective of increasing the proportion of adults who have had their blood

Asthma

Asthma is among the leading chronic conditions causing restricted activity, and a common cause of chronic illness in children. Effective management such as controlling exposure to factors that trigger asthma episodes and taking asthma medicine can help prevent the progression to functional limitation and disability, and improve the quality of life for persons with asthma.

Indicator 1: Ever been told by a doctor, nurse or health professional that respondent has asthma.

- The estimated proportion of adults who have been told they had asthma was approximately 13% based on aggregated county data from 2000-2005 (Table 19).

Indicator 2: Respondents who currently have asthma.

- The estimated proportion of adults who currently had asthma was 7.7% based on aggregated county data from 2000-2005 (Table 20).
- A significantly higher proportion of women than men reported currently having asthma (10% vs. 5.5%) based on aggregated county data.

Disability

People with disabilities may experience lack of access to health services and medical care, and may be at increased risk for various conditions. However, disability does not necessarily equate to poor health (Healthy People 2010, Volume I, 2nd edition).

Indicator 1: Limited in any activities because of physical, mental or emotional problems.

- About 18% of adults in the county reported they had some type of limitation based on aggregated county data (Table 21).
- Disability was more prevalent among older adults. Based on aggregated county data, the percentage of county adults with limitations increased from 9.2% among those aged 18-24 years to 27.8% among those aged 55 years and older.
- Disability status varied by income level. Individuals with annual household income less than \$15,000 were particularly affected by disability.

Indicator 2: Have any health problems now that require the use of special equipment such as a cane, a wheelchair, a special bed or a special phone.

- A reported 5.7% of adults in the county used some type of aid equipment based on aggregated county data (Table 22).
- Prevalence of disability as measured by the use of aid equipment has increased slightly in the county since 2001 (Figure 43).
- Use of aid equipment was more common among older adults and among individuals with lower household income.

Cardiovascular Disease

Prevalence Indicators: Cardiovascular disease or CVD (Indicator 1), defined as present if an affirmative response was provided to any of the BRFSS questions regarding the occurrences of heart attack or myocardial infarction (Indicator 2), the occurrences of angina or coronary heart disease (Indicator 3), and the occurrences of stroke (Indicator 4).

- The estimated proportion of county adults with CVD as defined by indicator 1 was 8.6% based on available data (Table 23).
- Based on a weighted multiple logistic regression analysis using the 2005 Nevada BRFSS data (results not shown), factors associated with CVD among Nevadans included gender (greater risk for males), aging, high blood pressure, high blood cholesterol, having smoked, having diabetes, obesity, lack of physical activity, and insufficient fruit and vegetable intake.

Cardiovascular Disease

Hospital Discharge Indicators: Number of hospital inpatient discharges, inpatient discharge charges, and discharge length of stay.

Coronary or ischemic heart disease accounts for the largest proportion of heart disease. Heart disease and stroke continue to be major causes of disability and contributors to increases in health care costs in the United States (Healthy People 2010, Volume I, 2nd edition).

Table 24. Major CVD Inpatient Discharges, Discharge Charges and Discharge Length of Stay, Clark County and Nevada, 2005 (ICD10 codes in parentheses)*

Cardiovascular Disease

Mortality

- For most CVDs, higher age-adjusted death rates (AADR) were seen among blacks than other racial groups (Figure 50).
- Diseases of heart are the leading cause of death for all people in the United States. In 2003, diseases of the heart as the underlying cause of death accounted for 3,094 deaths or 25.7% of all deaths among county residents. AADR for diseases of the heart was 239.9 per 100,000 population in the county (Table 26).
- Cerebrovascular diseases or stroke are the fourth leading cause of death (after diseases of heart, cancer and chronic lower respiratory diseases) in both Clark and Nevada, and the third leading cause of death (after diseases of heart and cancer) in the United States. In 2003, cerebrovascular diseases accounted for 688 deaths or 5.7% of all deaths among county residents. AADR for cerebrovascular diseases was 56.8 per 100,000 population in the county (Table 26).

Figure 50. Age-Adjusted Death Rates (Deaths per 100,000 Population per Year) for Selected CVDs by Demographic Subgroups, 2003

Source: CDC WONDER Mortality Module (available up to 2003 at the time this report was written).

*CDC WONDER adjusted population denominators in rates calculation since August 2006. As a result, rates presented here might not match those from previous CDC WONDER Mortality Module.

(*)Rates unreliable due to small counts of deaths in demographic subgroups (suppressed if counts of death less than 2).

Cancer

The American Cancer Society estimated that 1,399,790 new cancer cases (720,280 men and 679,510 women) were diagnosed in the United States in 2006, and 564,830 individuals died of cancer in the same year.

Incidence and Hospital Discharge Indicators: Cancer incidences and incidence rates, number of hospital inpatient discharges, inpatient discharge charges, and discharge length of stay.

- Both Clark and Nevada had higher incidences of cancer than the rest of the nation based on age-adjusted incidence rates (AAIR) for all cancers combined (Figure 51).
- Based on AAIR, the leading type of cancer in both the county and state was lung/bronchus cancer, reported at 82.4 new cases per 100,000 population per year in the county, compared with 79.3 new cases per 100,000 per year in the state and 70 new cases per 100,000 per year in the nation. Breast and prostate cancer had the second and third highest incidence rates in both the county and state (Figure 51).

- Cancer as the primary diagnosis accounted for 3.6% of all hospital inpatient discharges among Clark residents in 2005 (Table 27).
- Cancer as the primary diagnosis accounted for 0.3 billion dollars in total billed amounts or 6% of the total 5.05 billion dollars in billed amounts for all inpatient hospital discharges among Clark residents in 2005 (Table 27).
- In 2005, the five types of cancer that had the highest median billed amount in the county were: larynx (\$69,202), leukemia (\$59,361), ovary (\$54,592), stomach (\$52,932) and brain and other nervous system (\$52,120) cancer (Nevada Interactive Health Database System, Hospital Discharge Module).

*Suppressed if less than 0.1%

#Denominator includes all primary diagnosis codes (ICD9) in the range from 001 to 799 (i.e. diagnoses classified under injury, poisoning or non-ICD categories not included).

Cancer

- Higher incidences of cancer were seen among males than females. Based on AAIR, males reported 563.6 new cases per 100,000 population per year in the county, compared with 459.5 new cases per 100,000 per year reported among females. When compared with national gender-specific incidences however, a greater difference in AAIR was seen for females (459.5 in the county versus 413.8 in the nation) than for males during the selected time period (Figure 52).
- Prostate cancer was the leading type of cancer among males, with 4,093 new cases reported from 2000-03 in the county (Figure 52).
- Breast cancer was the leading type of cancer among females, with 4,352 new cases reported from 2000-03 in the county (Figure 52).
- Based on gender-specific AAIR, the second and third mostly reported cancer sites were lung/bronchus and colorectal for both males and females. The fourth mostly reported cancer site was urinary bladder for males, and corpus uteri and uterus NOS for females (Figure 52).

Figure 52. Age-Adjusted Incidence Rates (Incidences per 100,000 Population per Year) for the Top 15 Cancer Sites by Gender*

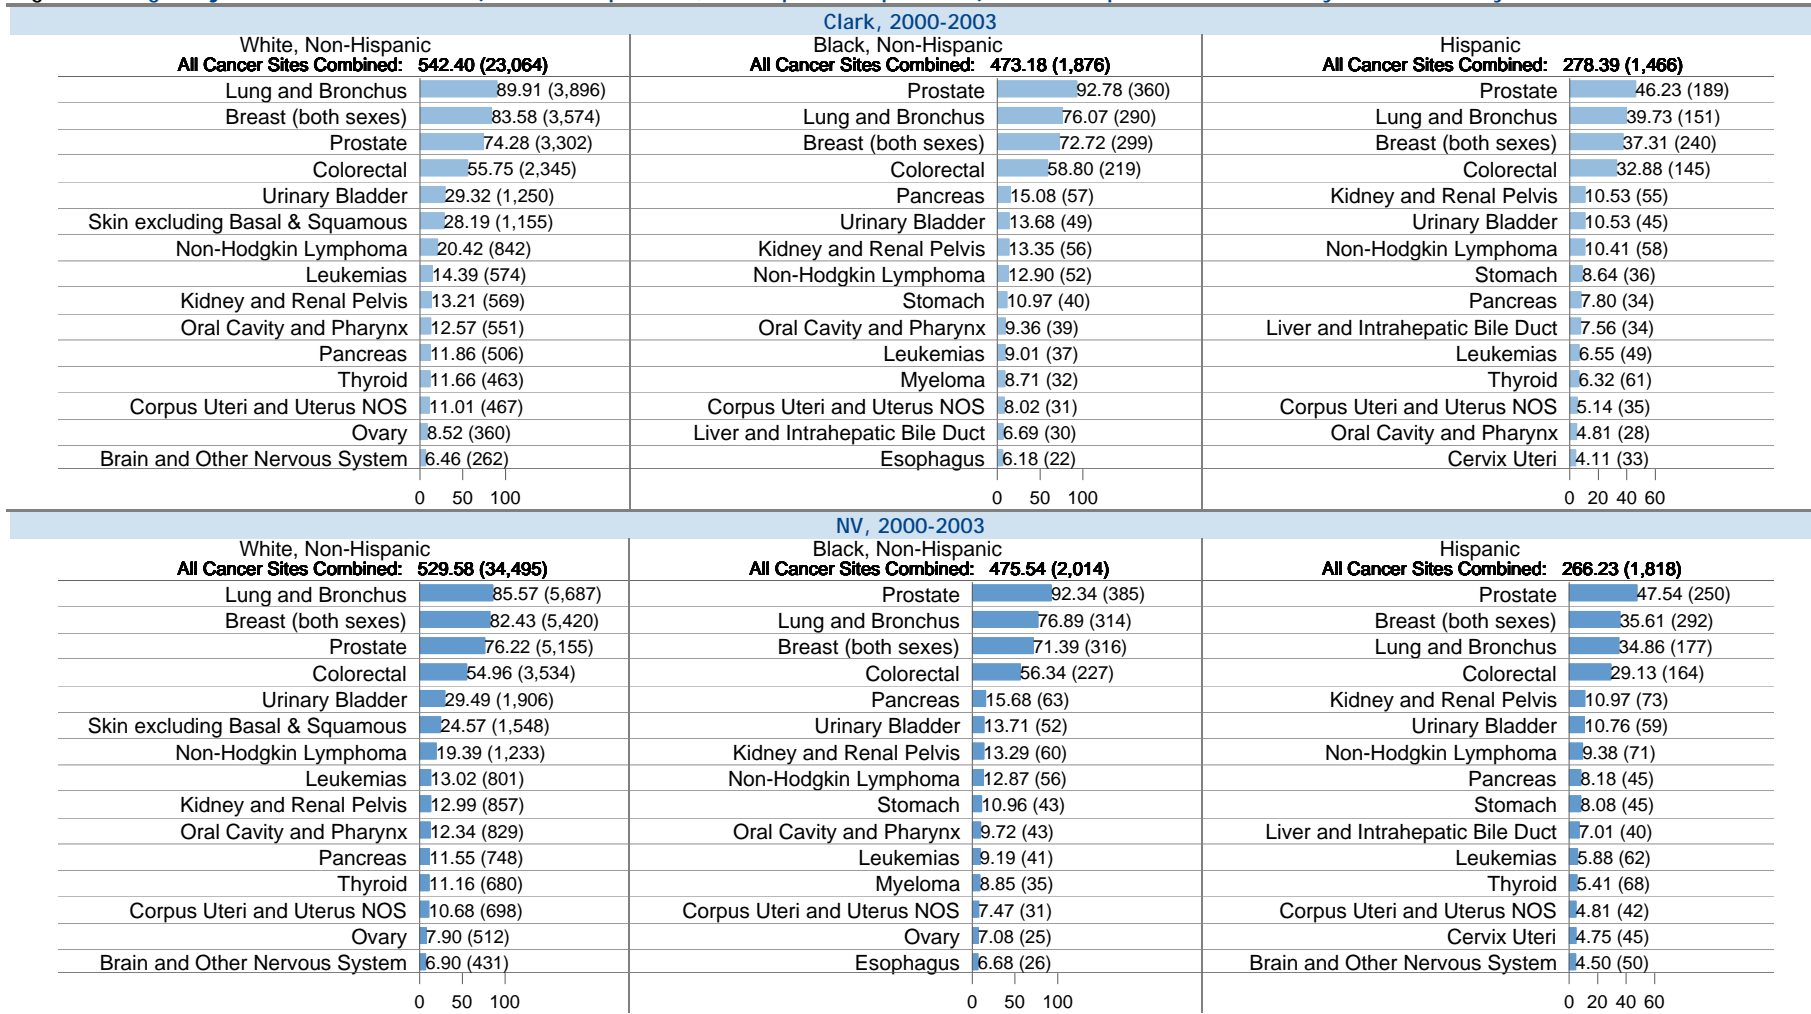

Source: National Program of Cancer Registries (available up to 2002 at the time this report was written) and the Cancer Module of NIHDS (available up to 2003 at the time this report was written). *Rank based on AAIR (incidences provided in parentheses). Cases of unspecified gender not included. Rates calculation used population of each gender as denominator.

Cancer

- Higher incidences of cancer were seen among non-Hispanic whites (WNH) than other racial/ethnic groups in both the county and state. Based on AAIR, WNH reported 542.4 new cases per 100,000 population per year in the county, compared with 473.2 new cases per 100,000 per year reported among non-Hispanic blacks (BNH) and 278.4 new cases per 100,000 per year reported among Hispanics (Figure 53).
- Lung/bronchus cancer was the leading type of cancer among WNH and the second leading type of cancer among BNH and Hispanics in the county (Figure 53).
- Among the selected racial/ethnic groups, WNH had the highest incidence rate for skin cancer, and BNH had the highest incidence rate for myeloma (Figure 53).

Figure 53. Age-Adjusted Incidence Rates (Incidence per 100,000 Population per Year) for the Top 15 Cancer Sites by Race/Ethnicity*

Source: NIHDS (national data by comparable race/ethnicity not available).

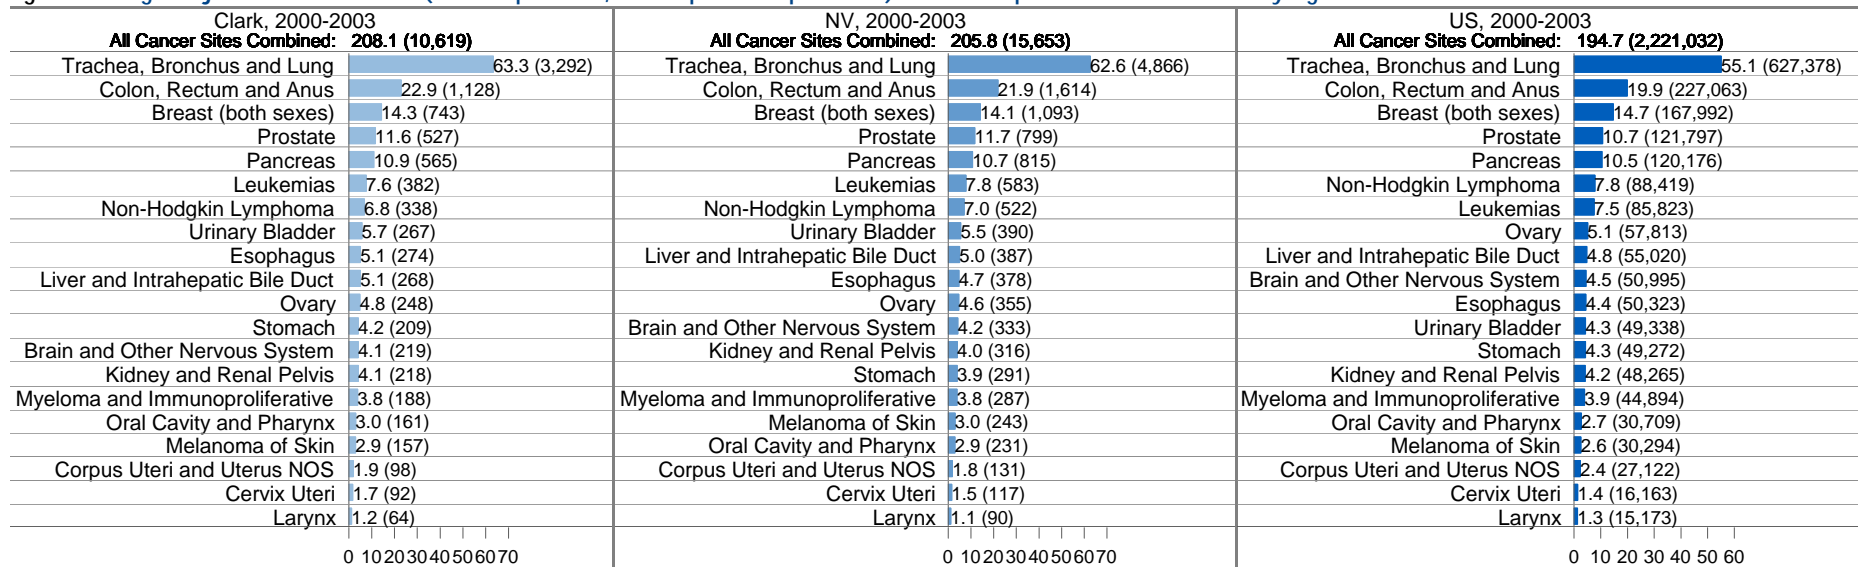

*Rank based on AAIR (incidences provided in parentheses). Rates calculation used population of each race/ethnicity (both gender combined) as denominator. AAIR for other racial/ethnic groups (Asian/Pacific islander, American Indian/Alaska Native) unreliable due to insufficient incidences in age bands for most cancer sites during the selected time period and not presented.

Mortality

- Cancer is the second leading cause of death in the nation (after diseases of heart). In 2003, cancer as the underlying cause of death accounted for 2,806 deaths or 23.3% of all deaths among county residents. Age-adjusted death rate (AADR) for cancer was 203.8 per 100,000 population in the county, compared with 202.3 per 100,000 in the state and 190.1 in the nation (CDC WONDER Mortality Module).
- Lung/bronchus cancer is the leading type of cancer for cancer causes of death. It accounted for 31% of all resident cancer deaths in Clark County from 2000 to 2003. The second leading type of cancer for mortality is colorectal cancer. It accounted for 10.6% of all cancer deaths in the county during the same period (Figure 54).
- A higher death rate for cancer was seen among males than females. Based on AADR, there were 247.9 cancer deaths per 100,000 population per year among male residents in the county, compared with 178 cancer deaths per 100,000 per year among female residents. When compared with national gender-specific death rates however, a greater difference in AADR was seen for females (178 in

- the county versus 164 in the nation) than for males during the selected time period (Figure 55).
- Based on gender-specific AADR, prostate cancer was the second leading type of cancer for mortality among males in both the state and nation, and the third leading type of cancer for mortality in the county from 2000 to 2003. Pancreatic cancer and leukemia were the fourth and fifth leading types of cancer for mortality among males during the same period (Figure 55).
- Based on gender-specific AADR, breast cancer was the second leading type of cancer for mortality among females from 2000 to 2003, followed by colorectal, pancreatic and ovarian cancer (Figure 55).
- Higher cancer mortality rates were seen among whites and blacks than other racial groups. AADR was also higher among whites in the county than in the nation (Figure 56).
- AADR for myeloma was highest among blacks (Figure 56).

Figure 54. Age-Adjusted Death Rates (Deaths per 100,000 Population per Year) for the Top 20 Cancers as Underlying Causes of Death*

Source: CDC WONDER Mortality Module (available up to 2003 at the time this report was written).

*Rank based on age-adjusted death rates (number of deaths provided in parentheses). Rates calculation for gender-specific cancer sites used population for both gender combined as denominator. Primary cancer sites based on ICD10 for cancer causes of death.

Cancer

Figure 55. Age-Adjusted Death Rates (Deaths per 100,000 Population per Year) for the Top 15 Cancers as Underlying Causes of Death by Gender*

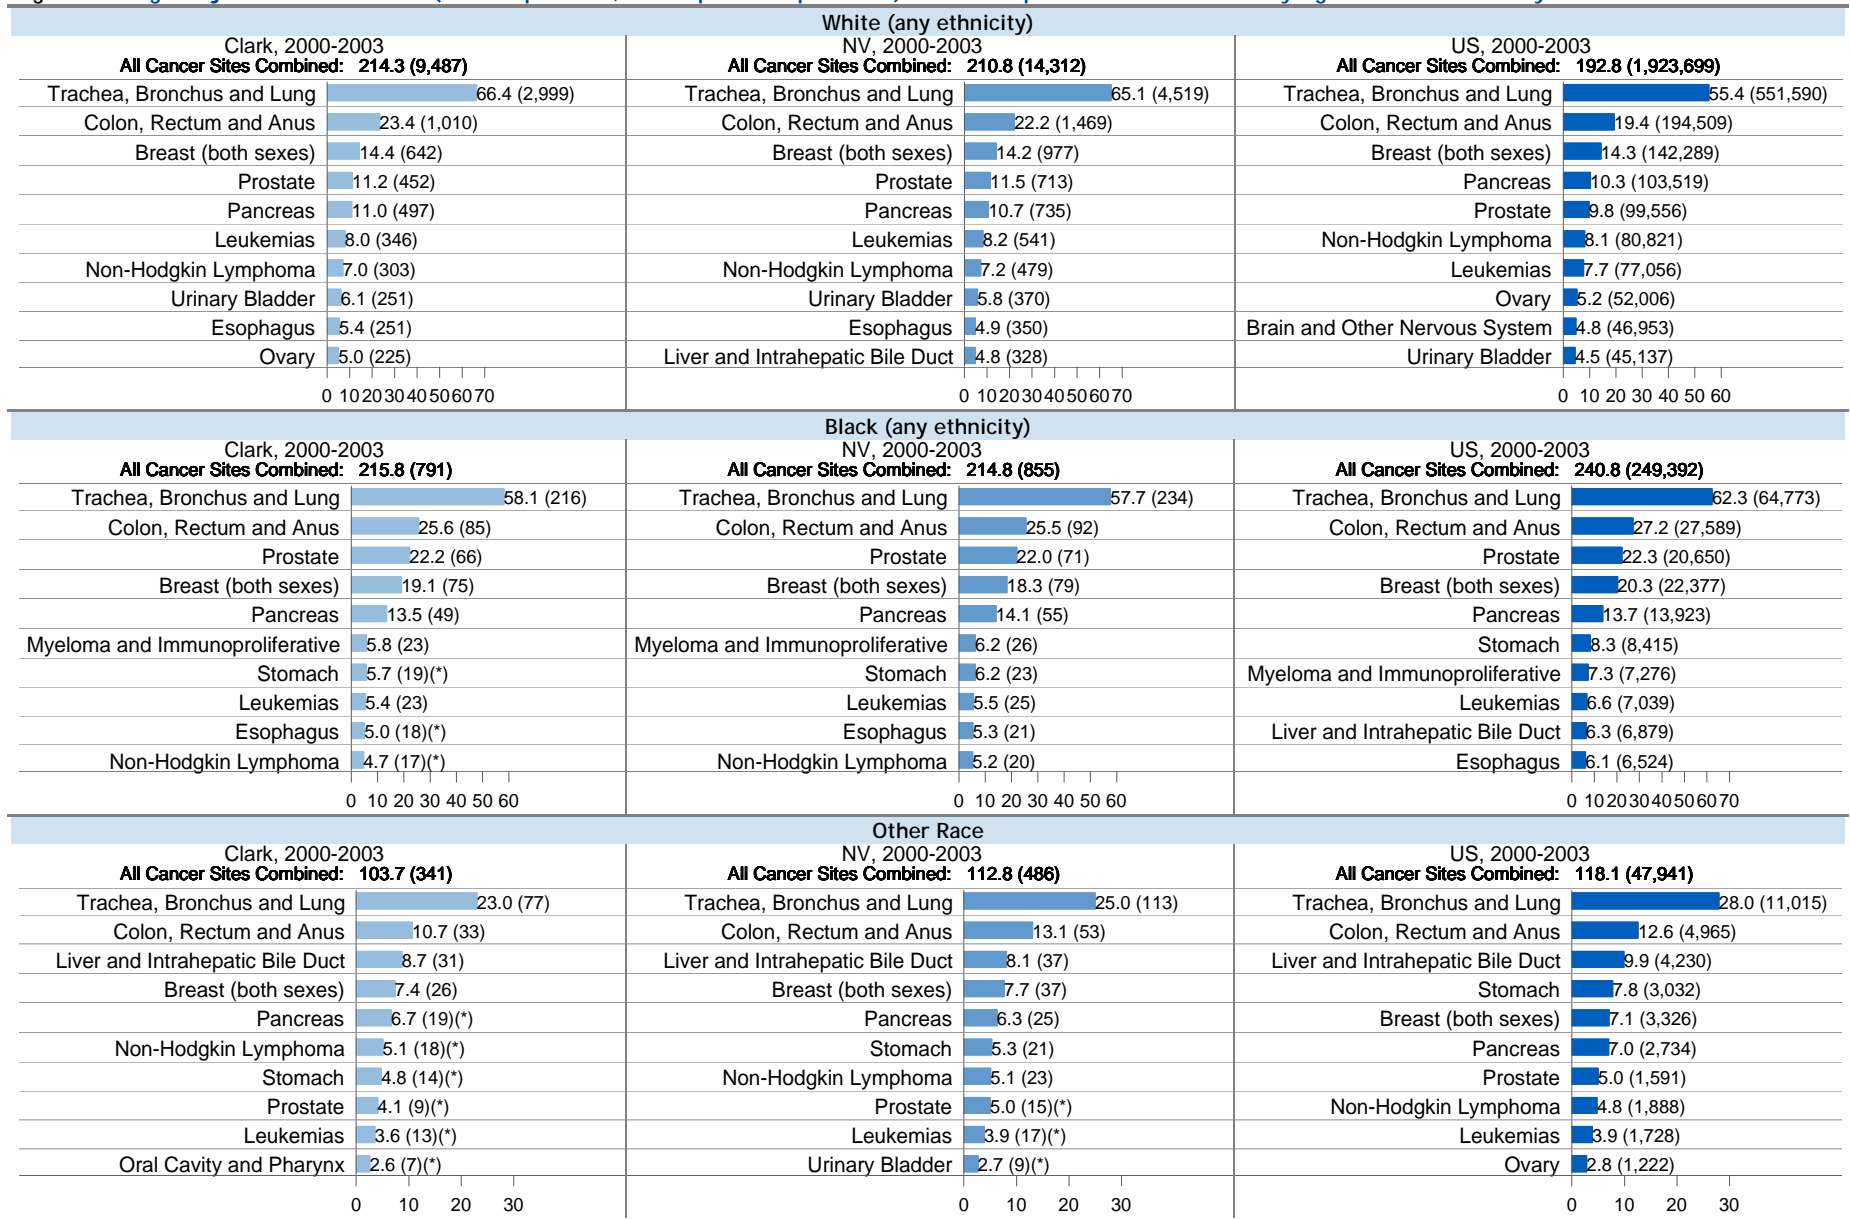

Source: CDC WONDER Mortality Module (available up to 2003 at the time this report was written).

*Rank based on AADR (number of deaths provided in parentheses). Rates calculation used population of each gender as denominator.

Cancer

Figure 56. Age-Adjusted Death Rates (Deaths per 100,000 Population per Year) for the Top 10 Cancers as Underlying Causes of Death by Race*

Source: CDC WONDER Mortality Module (available up to 2003 at the time this report was written).

*Rank based on AADR (number of deaths provided in parentheses). Rates calculation used population of each race (both gender combined) as denominator.

(*)Rates unreliable due to small counts of deaths in racial subgroups.

Cancer Awareness and Screening

Mammography is the best available method to detect breast cancer in its earliest, most treatable stage.

Indicator 1: Received mammogram within the past two years.
(Among females aged 40 years and older)

- The Healthy People 2010 objective—increasing the proportion of women aged 40 years and older who have received a mammogram within the preceding two years to 70%—appeared to have been met locally. Based on aggregated county data, about 73% of women aged 40 years and older received a mammogram within the past two years (Table 28).

Early detection of cervical cancer by a Pap test, coupled with appropriate treatment and follow-up, can substantially enhance the likelihood of survival.

Indicator 2: Received Pap test within the past three years.
(Among females aged 18 years and older)

- The Healthy People 2010 objective—increasing the proportion of women aged 18 years and older who received a Pap test within the preceding three years to 90%—was not met locally. Based on aggregated county data, 84% of women aged 18 years and older received a Pap test within the past three years (Table 29).

Prostate cancer is the most commonly diagnosed form of cancer in males and a leading cause of death among males in the United States. A Prostate-Specific Antigen (PSA) test can help detect this cancer in its early stage, when treatment is more effective.

Indicator 3: Received a PSA test within the past two years.
(Among males aged 40 years and older)

- Based on aggregated county data, about 50% of males aged 40 years and older received a PSA test within the past two years (Table 30).

Colorectal cancer deaths can be prevented if detected and treated early. A fecal occult blood test or blood stool test, and sigmoidoscopy are commonly used in screening examinations.

Indicator 4: Received blood stool test within the past two years.

Indicator 5: Ever received sigmoidoscopy or colonoscopy.
(Among adults aged 50 years and older)

- The Healthy People 2010 objective—increasing the proportion of adults aged 50 years and older who have received a blood stool test within the past two years to 50%—was not met locally. Based on aggregated county data, about 27% of adults aged 50 years and older received a blood stool test within the past two years (Table 31).
- The Healthy People 2010 objective—increasing the proportion of adults aged 50 years and older who have ever received a sigmoidoscopy to 50%—was not met locally. About 46% of adults aged 50 years and older received a sigmoidoscopy based on aggregated county data, (Table 32).

Selected Youth Risk Behaviors (Among 9th through 12th grade students in year 2005)

Injuries and Violence

- 24% of students in the county rode with a driver who had been drinking alcohol during the past month, compared with 26% in the state and 29% in the nation (Table 33).
- 8% of students in the county drove when they had been drinking alcohol during the past month, compared with 10% in both the state and nation (Table 34).
- 15% of students in the county carried a weapon such as a gun, knife or club during the past month, compared with 18% in the state and 19% in the nation (Table 35).
- 10% of students in the county did not attend school on one or more days during the past month because of safety concerns, compared with 9% in the state and 6% in the nation (Table 36).
- 10% of students in the county had been threatened or injured with a weapon on school property on one or more days during the past year, compared with 8% in both the state and nation (Table 37).
- 33% of students in the county were in a physical fight one or more times during the past year, compared with 35% in the state and 36% in the nation (Table 38).
- 17% of students in the county seriously considered attempting suicide during the past year, compared with 16% in the state and 17% in the nation (Table 39).
- 9% of students in the both the county and state actually attempted suicide one or more times during the past year, compared with 8% in the nation (Table 40).

Tobacco, Alcohol and Other Drug Use

- 49% of students in the county tried cigarette smoking in their lifetime, compared with 52% in the state and 54% in the nation (Table 41).
- 17% of students in the county smoked cigarettes on one or more days during the past month, compared with 18% in the state and 23% in the nation (Table 42).
- 39% of students in the county had at least one drink of alcohol on one or more days during the past month, compared with 41% in the state and 43% in the nation (Table 43).
- 21% of students in the county engaged in episodic heavy drinking, defined as having five or more drinks of alcohol in a row on one or more days during the past month, compared with 25% in the state and 26% in the nation (Table 44).
- 38% of students in the county used marijuana one or more times during their lifetime, compared with 39% in the state and 38% in the nation (Table 45).

- 18% of students in the county used marijuana one or more times during the past month, compared with 17% in the state and 20% in the nation (Table 46).
- 11% of students in both the county and state used some form of cocaine, including powder, crack, or freebase one or more times during their lifetime, compared with 8% in the nation (Table 47).
- 14% of students in the county sniffed glue, breathed the contents of aerosol spray cans, or inhaled paints or spays to get high one or more times during their lifetime, compared with 15% in the state and 12% in the nation (Table 48).
- 11% of students in the county and 12% in the state used methamphetamines one or more times during their lifetime, compared with a significantly lower national prevalence estimated at 6% (Table 49).
- 5% of students in the county took steroid pills or shots without a doctor's prescription one or more times during their lifetime, compared with 6% in the state and 4% in the nation (Table 50).
- 4% of students in both the county and state used illegal injection drugs one or more times during their lifetime, compared with 2% in the nation (Table 51).
- 38% of students in the county and 33% in the state were offered, sold or given illegal drugs on school property during the past year, compared with a significantly lower national prevalence estimated at 25% (Table 52).

Physical Activity, Weight Status and Weight Control Behaviors

- 10% of students in the county had not participated in any vigorous or moderate physical activity during the past seven days, compared with 9% in the state and 10% in the nation (Table 53).
- 30% of students in both the county and state described themselves as slightly or very overweight, compared with 32% in the nation (Table 54).
- 13% of students in the county went without eating for 24 hours or more to lose or to control weight during the past month, compared with 12% in both the state and nation (Table 55).
- 10% of students in the county took diet pills, powders or liquids without a doctor's advice to lose or control weight during the past month, compared with 9% in the state and 6% in the nation (Table 56).
- 9% of students in the county and 8% in the state vomited or took laxatives to lose or control weight during the past month, compared with a significantly lower national prevalence estimated at 5% (Table 57).
